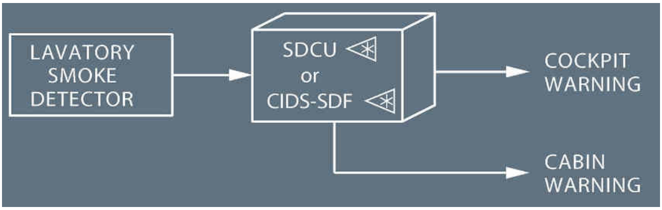
SMOKE DETECTION

Ident.: DSC-26-40-10-00021441.0001001 / 17 MAR 17
Applicable to: ALL

The lavatory smoke detection system consists of:
- One smoke detector, in the air extraction duct of the lavatory
- A double channel Smoke Detection Control Unit (SDCU) ◁ or a Cabin Intercommunication Data Systems (CIDS) with a Smoke Detection Function (SDF) ◁ that triggers the applicable alerts (cockpit and cabin).

In the case of smoke in a lavatory, the detector sends a signal to the SDCU or CIDS, which transmits it to the Flight Warning Computer (FWC) for warning in the cockpit and in the cabin.



WASTEBIN FIRE EXTINGUISHING

Ident.: DSC-26-40-10-00001034.0001001 / 21 MAR 16
Applicable to: ALL

Each lavatory wastebin has an automatic fire extinguishing system.

SMOKE DETECTION

Ident.: DSC-26-50-10-00021442.0004001 / 17 MAR 17

1 **Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

The forward and aft cargo compartments smoke detection system consists of:
- 4 smoke detectors that are in the forward cargo compartment ceiling panel cavities. Each detector is linked to one of the two detection loops (dual loop principle).
- 6 smoke detectors that are in the aft cargo compartment ceiling panel cavities. Each detector is linked to one of the two detection loops (dual loop principle).
- A Smoke Detection Control Unit (SDCU) ◁ with two identical channels, or a Cabin Intercommunication Data Systems (CIDS) with a Smoke Detection Function (SDF) ◁ , that receives signals from the smoke detectors, and transmits it to the ECAM.

Smoke in one cavity activates the cargo smoke warning if:
- Both smoke detectors detect smoke, or
- One smoke detector detects smoke and the other is inoperative.

Cargo isolation valves ◁ close automatically, and the extraction fan ◁ stops when the cargo smoke warning is activated.

FIRE EXTINGUISHING

3 Ident.: DSC-26-50-10-00021443.0024001 / 22 MAR 18

Applicable to: MSN 11531

A fire extinguishing system protects the forward and aft cargo compartments.

Two fire bottles with two discharge heads, one for each compartment, supply five nozzles:
- Two nozzles in the forward cargo compartment
- Three nozzles in the aft cargo compartment.

When the FWD(AFT) SMOKE light comes on, the flight crew selects the corresponding DISCH pb. This action simultaneously ignites the corresponding squib on the fire bottles, which then discharge the extinguishing agent into that compartment.
Bottle 1 discharges in approximately 60 s. A flow metering system controls the discharge of bottle 2 for at least 75 min.
When bottle 1(2) is empty, the BTL1(2) light comes on amber.

FIRE EXTINGUISHING

Ident.: DSC-26-50-10-00021443.0007001 / 17 MAR 17

Applicable to: MSN 02014, 04827-04860

A fire extinguishing system protects the forward and aft cargo compartments.

Two fire bottles with two discharge heads, one for each compartment, supply three nozzles:
- One nozzle in the forward cargo compartment
- Two nozzles in the aft cargo compartment.

When the FWD(AFT) SMOKE light comes on, the flight crew selects AGENT 1 with the corresponding DISCH sw. This action ignites the corresponding squib on the fire bottle, which then discharges the extinguishing agent into that compartment.
60 min after the discharge of AGENT 1, the DISCH AGENT 2 light comes on to indicate that the flight crew has to discharge AGENT 2 to maintain the required extinguisher concentration in the cargo compartment.
Bottle 1 discharges in approximately 60 s. A flow metering system controls the discharge of bottle 2 in approximately 90 min. This ensures sufficient agent concentration for 205 min.
When bottle 1(2) is empty, the DISCH 1(2) light comes on amber.

TEST PB

Tests the operation of the cargo smoke detection system.

When pressed for at least 3 s, and until released:
- Tests the smoke detectors in sequence
- Turns on the red SMOKE lights twice, and displays the ECAM warning
- Closes the isolation valves of the cargo ventilation system ⊲
- The DISCH lights come on in amber.

Ident.: DSC-26-50-20-10-00021452.0001001 / 17 MAR 17

5 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

DISCH LIGHT

Within 60 s after pressing the discharge pushbutton, the amber DISCH light comes on when the associated bottle is fully discharged.

Ident.: DSC-26-50-20-10-00021454.0001001 / 17 MAR 17

6 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

DISCH PB

The DISCH pb ignites the squib, thereby discharging the extinguishing agent in the affected cargo compartment.

Ident.: DSC-26-50-20-10-00021455.0001001 / 17 MAR 17

Applicable to: MSN 02014, 04827-04860

DISCH AGENT 2 LIGHT

This light comes on amber, 60 min after the discharge of AGENT 1 in the affected cargo compartment. The light goes off when the AGENT 2 squib is ignited.

Ident.: DSC-26-50-20-10-00021456.0001001 / 17 MAR 17
Applicable to: MSN 02014, 04827-04860

DISCH SW

The guarded DISCH sw permits ignition of the corresponding squib for discharge of extinguishing AGENT 1(2) in the respective cargo compartment (FWD or AFT).

GENERAL

Ident.: DSC-27-10-10-00001043.0001001 / 21 MAR 16
Applicable to: ALL

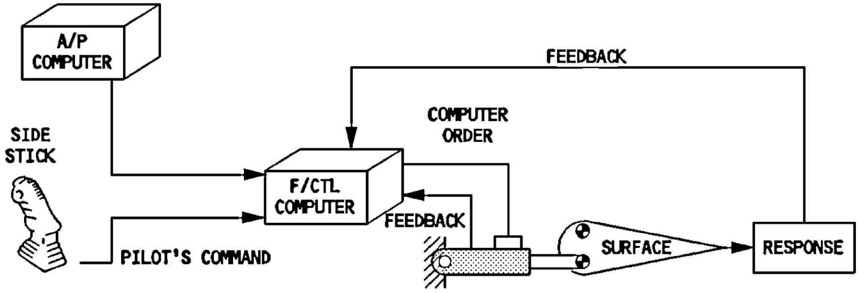
The fly-by-wire system was designed and certified to render the new generation of aircraft even more safe, cost effective, and pleasant to fly.

BASIC PRINCIPLE

Ident.: DSC-27-10-10-00001044.0001001 / 17 MAY 21
Applicable to: ALL

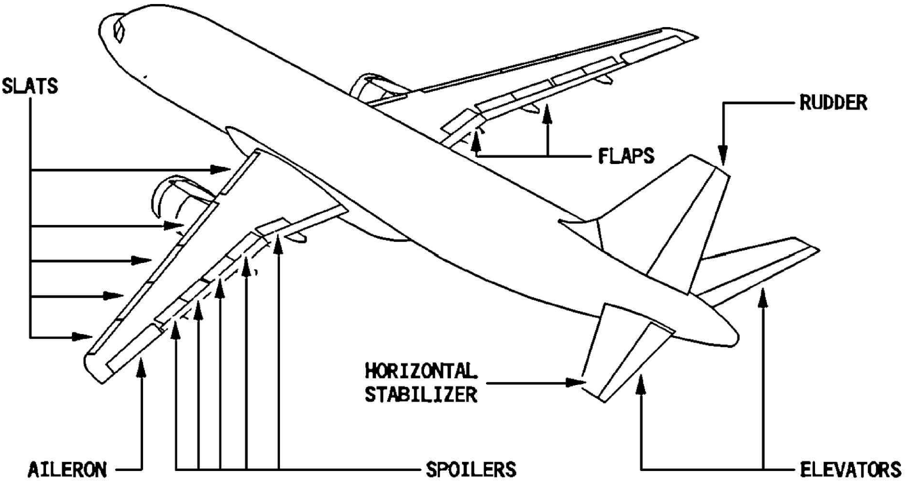
Flight control surfaces are all :
- Electrically-controlled, and
- Hydraulically-actuated.

The stabilizer and rudder can also be mechanically-controlled.
Pilots use sidesticks to fly the aircraft in pitch and roll (and in yaw, indirectly, through turn coordination).
Computers interpret pilot input and move the flight control surfaces, as necessary, to follow their orders.
However, when in normal law, regardless of the pilot’s input, the computers will prevent excessive maneuvers and exceedance of the safe envelope in pitch and roll axis.
However, as on conventional aircraft, the rudder has no such protection.



CONTROL SURFACES

Ident.: DSC-27-10-10-00001045.0001001 / 21 MAR 16
Applicable to: ALL



The flight controls are electrically or mechanically controlled as follows :

PITCH AXIS

Elevator = Electrical
Stabilizer = Electrical for normal or alternate control. Mechanical for manual trim control

ROLL AXIS

Ailerons = Electrical
Spoilers = Electrical

YAW AXIS

Rudder = Mechanical, however control for yaw damping, turn coordination and trim is electrical.

SPEED BRAKES

Speed brakes = Electrical

Note: *All surfaces are hydraulically actuated.*

COCKPIT CONTROLS

Ident.: DSC-27-10-10-00001046.0001001 / 21 MAR 16
Applicable to: ALL

- Each pilot has a sidestick controller with which to exercise manual control of pitch and roll. These are on their respective lateral consoles.
  The two sidestick controllers are not coupled mechanically, and they send separate sets of signals to the flight control computers.
- Two pairs of pedals, which are rigidly interconnected, give the pilot mechanical control of the rudder.
- The pilots control speed brakes with a lever on the center pedestal.
- The pilots use mechanically interconnected handwheels on each side of the center pedestal to control the trimmable horizontal stabilizer.
- The pilots use a single switch on the center pedestal to set the rudder trim.
- There is no manual switch for trimming the ailerons.

COMPUTERS

Ident.: DSC-27-10-10-00001047.0001001 / 21 MAR 16
Applicable to: ALL

Seven flight control computers process pilot and autopilot inputs according to normal, alternate, or direct flight control laws.
The computers are :

2 ELACs

(Elevator Aileron Computer)

For : Normal elevator and stabilizer control.
Aileron control.

3 SECs

(Spoilers Elevator Computer)

For : Spoilers control.
Standby elevator and stabilizer control.

2 FACs

(Flight Augmentation Computer)

For : Electrical rudder control.

IN ADDITION 2 FCDC

Flight Control Data Concentrators (FCDC) acquire data from the ELACs and SECs and send it to the electronic instrument system (EIS) and the centralized fault display system (CFDS).

SIDESTICK
COMMANDS
SEC (1) (2)

Two elevators and the Trimmable Horizontal Stabilizer (THS) control the aircraft in pitch. The maximum elevator deflection is 30 ° nose up, and 17 ° nose down. The maximum THS deflection is 13.5 ° nose up, and 4 ° nose down.

Ident.: DSC-27-10-20-A-00001050.0001001 / 21 MAR 16

ELECTRICAL CONTROL

- In normal operations, ELAC2 controls the elevators and the horizontal stabilizer, and the green and yellow hydraulic jacks drive the left and right elevator surfaces respectively.
  The THS is driven by N° 1 of three electric motors.
- If a failure occurs in ELAC2, or in the associated hydraulic systems, or with the hydraulic jacks, the system shifts pitch control to ELAC1. ELAC1 then controls the elevators via the blue hydraulic jacks and controls the THS via the N° 2 electric motor.
- If neither ELAC1 nor ELAC2 is available, the system shifts pitch control either to SEC1 or to SEC2, (depending on the status of the associated circuits), and to THS motor N° 2 or N° 3.

In case of failure, the actuators are reconfigured, *Refer to DSC-27-10-20 Pitch Control - Schematic*.

Ident.: DSC-27-10-20-A-00001051.0001001 / 21 MAR 16

MECHANICAL CONTROL

Mechanical control of the THS is available from the pitch trim wheel at any time, if either the green or yellow hydraulic system is functioning.
Mechanical control from the pitch trim wheel has priority over electrical control.

Ident.: DSC-27-10-20-A-00001053.0002001 / 21 MAR 16

ACTUATION

ELEVATORS

- Two electrically-controlled hydraulic servojacks drive each elevator.

  Each servojack has three control modes :
  - Active : The jack position is electrically-controlled.
  - Damping : The jack follows surface movement.
  - Centering : The jack is hydraulically retained in the neutral position.
- In normal operation :
  - One jack is in active mode.
  - The other jack is in damping mode.
  - Some maneuvers cause the second jack to become active.
- If the active servojack fails, the damped one becomes active, and the failed jack is automatically switched to damping mode.
- If neither jack is being controlled electrically, both are automatically switched to the centering mode.
- If neither jack is being controlled hydraulically, both are automatically switched to damping mode.
- If one elevator fails, the deflection of the remaining elevator is limited in order to avoid putting excessive asymmetric loads on the horizontal tailplane or rear fuselage.

STABILIZER

- A screwjack driven by two hydraulic motors drives the stabilizer.
- The two hydraulic motors are controlled by :
  - One of three electric motors, or
  - The mechanical trim wheel.

GENERAL

One aileron and four spoilers on each wing control the aircraft about the roll axis.
The maximum deflection of the ailerons is 25 °.
The ailerons extend 5 ° down when the flaps are extended (aileron droop).
The maximum deflection of the spoilers is 35 °.

Ident.: DSC-27-10-20-B-00001056.0001001 / 21 MAR 16
Applicable to: ALL

ELECTRIC CONTROL

- The ELAC 1 normally controls the ailerons.
  If ELAC1 fails, the system automatically transfers aileron control to ELAC2.
  If both ELACs fail, the ailerons revert to the damping mode.
- SEC3 controls the N° 2 spoilers, SEC1 the N° 3 and 4 spoilers, and SEC2 the N° 5 spoilers.
  If a SEC fails, the spoilers it controls are automatically retracted.

Ident.: DSC-27-10-20-B-00001057.0001001 / 21 MAR 16
Applicable to: ALL

ACTUATION

AILERONS

Each aileron has two electrically controlled hydraulic servojacks.
One of these servojacks per aileron operates at a time.

Each servojack has two control modes :

Active : Jack position is controlled electrically
Damping : Jack follows surface movement.

The system automatically selects damping mode, if both ELACs fail or in the event of blue and green hydraulic low pressure.

SPOILERS

A servojack positions each spoiler. Each servojack receives hydraulic power from either the green, yellow, or blue hydraulic system, controlled by the SEC1, 2 or 3 (*Refer to DSC-27-10-20 General Architecture* diagram).
The system automatically retracts the spoilers to their zero position, if it detects a fault or loses electrical control.
If the system loses hydraulic pressure, the spoiler retains the deflection it had at the time of the loss, or a lesser deflection if aerodynamic forces push it down.
When a spoiler surface on one wing fails, the symmetric one on the other wing is inhibited.

SPEED BRAKES AND GROUND SPOILERS

Ident.: DSC-27-10-20-C-00001058.0017001 / 28 NOV 19
Applicable to: MSN 04441-04544, 04827-04974, 05066, 05101-05222, 05342, 05591-05643

SPEED BRAKE CONTROL

The pilot controls the speedbrakes with the speed brake lever.
The speedbrakes are actually spoilers 2, 3 and 4.

Speedbrake extension is inhibited, if:
- SEC 1 and SEC 3 both have faults, or
- An elevator (L or R) has a fault, or
- Angle-of-attack protection is active, or
- Flaps are in configuration FULL, or
- Thrust levers above MCT position, or
- Alpha Floor activation.

If an inhibition occurs when the speedbrakes are extended, they retract automatically and stay retracted until the inhibition condition disappears and the flight crews reset the lever. (The speedbrakes can be extended again 10 s or more after the lever is reset).
When a speedbrake surface on one wing fails, the symmetric one on the other wing is inhibited.

Note: 1. *For maintenance purposes, the speedbrake lever will extend the N° 1 surfaces when the aircraft is stopped on ground, whatever the slat/flap configuration*
2. *When the aircraft is flying faster than 315 kt or M 0.75 with the autopilot engaged, the speedbrake retraction rate is reduced (retraction from FULL to CLEAN takes about 25 s).*

L2 The maximum speedbrake deflection in manual flight is:
40 ° for spoilers 3 and 4 (reduced to 25 ° in CONF 0 when GW > MLW + 2 t)
20 ° for spoiler 2 (reduced to 12.5 ° in CONF 0 when GW > MLW + 2 t).

The maximum speedbrake deflection with the autopilot engaged is:
25 ° for spoilers 3 and 4
12.5 ° for spoiler 2.

The maximum speedbrake deflection achievable with the autopilot engaged is obtained by setting the speedbrake lever to the half way position. On setting the position of the speedbrake lever from half to full, no increase in speedbrake deflection will be achieved.
For these surfaces (which perform both roll and speedbrake functions) the roll function has priority. When the sum of a roll order and a simultaneous speedbrake order on one surface is greater than the maximum deflection available in flight, the same surface on the other wing is retracted until the difference between the two surfaces is equal to the roll order.

Ident.: DSC-27-10-20-C-00001058.0011001 / 10 MAY 21

3 **Applicable to: MSN 01143-01518, 01593-01628, 01825, 01832, 02014, 02734, 02896-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 05240, 05749-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

SPEED BRAKE CONTROL

The flight crew controls the speedbrakes with the speed brake lever.
The speedbrakes are spoilers 2, 3 and 4.

Speedbrake extension is inhibited, if one of the following occurs:
- SEC1 and SEC3 both are faulty, or
- An elevator (L or R) is faulty, or
- Angle-of-attack protection is active, or
- Flaps are in configuration FULL, or
- Thrust levers are above MCT position, or
- Alpha Floor is activated.

If an inhibition occurs when the speedbrakes are extended, they retract automatically and stay retracted until the inhibition condition disappears and the flight crew resets the lever (the speedbrakes can be extended again 10 s or more after the lever is reset).
When a speedbrake surface on one wing fails, the symmetric speedbrake surface on the other wing is inhibited.

Note: 1. *For maintenance purposes, the speedbrake lever will extend the N° 1 surfaces when the aircraft is stopped on ground, whatever the slat/flap configuration.*
2. *When the aircraft is flying faster than 315 kt or M 0.75 with the autopilot engaged, the speedbrake retraction rate is reduced (retraction from FULL to CLEAN takes about 25 s).*

L2 The maximum speedbrake deflection in manual flight is:
- 40 ° for spoilers 3 and 4
- 20 ° for spoiler 2.

The maximum speedbrake deflection with the autopilot engaged is:
- 25 ° for spoilers 3 and 4
- 12.5 ° for spoiler 2.

The maximum speedbrake deflection achievable with the autopilot engaged is obtained by setting the speedbrake lever to the half way position. On setting the position of the speedbrake lever from half to full, no increase in speedbrake deflection will be achieved.
For these surfaces (which perform both roll and speedbrake functions) the roll function has priority: When the sum of a roll order and a simultaneous speedbrake order on one surface is more than the maximum deflection available in flight, the symmetric speedbrake on the other wing is retracted until the difference between the two surfaces is equal to the roll order.

Ident.: DSC-27-10-20-C-00001058.0013001 / 10 MAY 21

4 **Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

The flight crew controls the speedbrakes with the speedbrake lever.
The speedbrakes are spoilers 2, 3 and 4.

Speedbrake extension is inhibited, if one of the following occurs:
- SEC1 and SEC3 both are faulty, or
- An elevator (L or R) is faulty, or
- Angle-of-attack protection is active, or
- Flaps are in configuration 3 or FULL, or
- Thrust levers are above MCT position, or
- Alpha Floor is activated.

If an inhibition occurs when the speedbrakes are extended, they automatically retract and remain retracted until the inhibition condition disappears and the flight crew resets the lever (the speedbrakes can be extended again, 10 s or more after the lever is reset).
When a speedbrake surface on one wing fails, the symmetric speedbrake surface on the other wing is inhibited.

Note: 1. *For maintenance purposes, the speedbrake lever will extend the N° 1 surfaces when the aircraft is stopped on ground, regardless of the slat/flap configuration.*
2. *When the aircraft is flying faster than 315 kt or M 0.75 with the autopilot engaged, the speedbrake retraction rate is reduced (retraction from FULL to CLEAN takes about 25 s).*

L2 The maximum deflection for the spoilers 2, 3 and 4 is 25 °.
For these surfaces (which perform both roll and speedbrake functions) the roll function has priority: When the sum of a roll order and a simultaneous speedbrake order on one surface is more than the maximum deflection available in flight, the symmetric speedbrake on the other wing is retracted until the difference between the two surfaces is equal to the roll order.

Ident.: DSC-27-10-20-C-00001058.0014001 / 10 MAY 21
Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05345

The flight crew controls the speedbrakes with the speedbrake lever.
The speedbrakes are spoilers 2, 3 and 4.

Speedbrake extension is inhibited, if one of the following occurs:
- SEC1 and SEC3 both are faulty, or
- An elevator (L or R) is faulty, or
- Angle-of-attack protection is active, or
- Flaps are in configuration FULL, or
- Thrust levers are above MCT position, or
- Alpha Floor is activated.

If an inhibition occurs when the speedbrakes are extended, they automatically retract and remain retracted until the inhibition condition disappears and the flight crew resets the lever (the speedbrakes can be extended again, 10 s or more after the lever is reset).
When a speedbrake surface on one wing fails, the symmetric speedbrake surface on the other wing is inhibited.

Note: 1. *For maintenance purposes, the speedbrake lever will extend the N° 1 surfaces when the aircraft is stopped on ground, regardless of the slat/flap configuration.*
2. *When the aircraft is flying faster than 315 kt or M 0.75 with the autopilot engaged, the speedbrake retraction rate is reduced (retraction from FULL to CLEAN takes about 25 s).*

L2 The maximum deflection for the spoilers is:

- 25 ° for spoilers 3 and 4
- 12.5 ° for spoiler 2 in configuration 3, and 17.5 ° in other configurations.

For these surfaces (which perform both roll and speedbrake functions) the roll function has priority: When the sum of a roll order and a simultaneous speedbrake order on one surface is more than the maximum deflection available in flight, the symmetric speedbrake on the other wing is retracted until the difference between the two surfaces is equal to the roll order.

Applicable to: ALL

GROUND SPOILER CONTROL

The ground spoiler function involves all spoilers (full extension) and ailerons (Aileron Anti Droop ◁✳).
When a ground spoiler surface on one wing fails, the symmetric ground spoiler surface on the other wing is inhibited.

ARMING

The pilot arms the ground spoilers by pulling the speedbrake control lever up into the armed position.

FULL EXTENSION – REJECTED TAKEOFF PHASE

- ■ If the ground spoilers are armed and the wheel speed exceeds 72 kt, the ground spoilers will automatically extend as soon as both thrust levers are reset to idle.
- ■ If the ground spoilers are not armed and the wheel speed exceeds 72 kt, the ground spoilers will automatically extend as soon as reverse is selected on one engine (the other thrust lever remains at idle).

FULL EXTENSION - LANDING PHASE

The ground spoilers will automatically extend when the following conditions are met:

- Speed brake lever not in the retracted position or ground spoilers armed and:
  - Both main landing gears on ground,
  - Both thrust levers at or below Idle position, or Reverse selected on at least one engine (and the other thrust lever below MCT position).
- Speed brake lever in the retracted position but ground spoilers not armed and:
  - Both main landing gears on ground,
  - Reverse selected on at least one engine (and the other thrust lever below MCT position).

The ailerons are fully-extended (Aileron Anti Droop ◁✳), provided one aileron servocontrol is available on each side, when:
- The ground spoilers are fully extended
- Flaps are not in clean CONF
- Pitch attitude is lower than 2.5 °
- Flying manually
- In normal law only.

PARTIAL EXTENSION

In order to accelerate the full spoiler extension, the Phased Lift Dumping (PLD) function allows the ground spoilers to deploy with a reduced deflection when the following conditions are met:
- Speed brake lever not in the retracted position or ground spoilers armed and:
  - One main landing gear on ground,
  - Both thrust levers at or below Idle position.
- Speed brake lever in the retracted position but ground spoilers not armed and:
  - One main landing gear on ground,
  - Reverse selected on at least one engine (and the other thrust lever below MCT position).

In order to reduce the bounce severity at landing in the case of an inappropriate thrust lever handling during flare, ground spoilers are also partially deployed when the following conditions are met:
- Ground spoilers armed,
- Both main landing gears on ground,
- Both thrust levers at or below the Climb position.

RETRACTION

The ground spoilers retract:
- After landing, when the ground spoilers are disarmed
- After a rejected takeoff, when the ground spoilers are disarmed
- During a touch and go, when at least one thrust lever is advanced above 20 °.

One rudder surface controls yaw.

Ident.: DSC-27-10-20-D-00001062.0001001 / 21 MAR 16

ELECTRICAL RUDDER CONTROL

The yaw damping and turn coordination functions are automatic.
The ELACs compute yaw orders for coordinating turns and damping yaw oscillations, and transmit them to the FACs.

Ident.: DSC-27-10-20-D-00001063.0001001 / 21 MAR 16

MECHANICAL RUDDER CONTROL

The pilots can use conventional rudder pedals to control the rudder.

Ident.: DSC-27-10-20-D-00001064.0001001 / 21 MAR 16

RUDDER ACTUATION

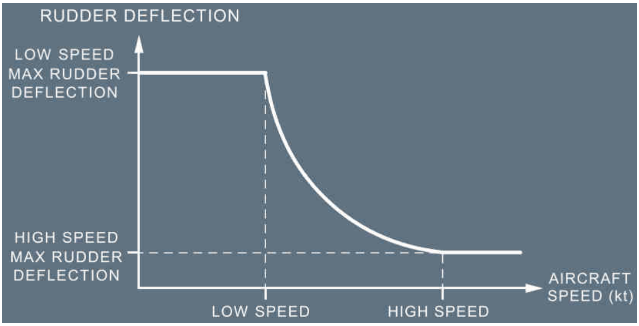
Three independent hydraulic servojacks, operating in parallel, actuate the rudder. In automatic operation (yaw damping, turn coordination) a green servo actuator drives all three servojacks. A yellow servo actuator remains synchronized and takes over if there is a failure.

There is no feedback to the rudder pedals from the yaw damping and turn coordination functions.

Ident.: DSC-27-10-20-D-00001065.0003001 / 21 MAR 16

RUDDER TRAVEL LIMIT

The maximum rudder travel deflection gradually reduces as the speed increases, to avoid structural loads:



In the case of a failure that causes loss of the Rudder Travel limit system, the rudder deflection limit stops at the last value reached. At slats extension, full rudder travel authority is recovered.
In all cases, the available rudder deflection provides sufficient yaw control within the entire flight envelope. This includes the case of maximum asymmetric thrust.

Ident.: DSC-27-10-20-D-00015506.0001001 / 21 MAR 16

RELATIONSHIP BETWEEN SIDESLIP/RUDDER DEFLECTION/RUDDER PEDAL TRAVEL

Regardless of the aircraft speed, therefore the maximum rudder deflection, full rudder pedal travel remains available. However, except at low speed, maximum rudder deflection is achieved before reaching maximum rudder pedal travel.

Ident.: DSC-27-10-20-D-00001066.0002001 / 21 MAR 16

RUDDER TRIM

The two electric motors that position the artificial feel unit also trim the rudder. In normal operation, motor N° 1 (controlled by FAC1), powers the trim, and FAC2 with motor N° 2 remains synchronized as a backup.
In manual flight, the pilot can apply rudder trim via the rotary RUD TRIM switch on the pedestal.
The pilot can use a button on the RUD TRIM panel to reset the rudder trim to zero.

Note: *With the autopilot engaged, the FMGC computes the rudder trim orders. The rudder trim rotary switch and the rudder trim reset pushbutton are not active.*

SHORT AIRFIELD PACKAGE (SHARP)

Ident.: DSC-27-10-20-00021696.0003001 / 01 JUN 17

5 **Applicable to: MSN 08495-09324, 10949-11522, 11572-11597**

SHARP (Short Airfield Package) is a set of aircraft modifications allowing operations on short runway:

- An improved leading edge root fillet
- A Vortex Generators on trailing edge panels.

SHARP improves aerodynamic Vertical Tail Plane (VTP) efficiency during take-off, approach speed and braking phases at landing.

General

GENERAL

1 Ident.: DSC-27-20-10-10-00001068.0006001 / 04 JUN 19
Applicable to: MSN 11531

The normal flight control laws provides:
- Aircraft control on the 3 axis
- Flight envelope protection
- Alleviation of maneuver loads.

One of the PF's primary tasks is to maintain the aircraft within the limits of the normal flight envelope. However, some circumstances, due to extreme situations or aircraft mishandling, may provoke the violation of these limits.
Despite system protections, the PF must not deliberately exceed the normal flight envelope. In addition, these protections are not designed to be structural limit protections (e.g. opposite rudder pedal inputs). Rather, they are designed to assist the PF in emergency and stressful situations, where only instinctive and rapid reactions will be effective.

Protections are intended to:
- Provide maximum authority to the PF to consistently achieve the best possible aircraft performance in extreme conditions
- Reduce the risks of overcontrolling, or overstressing the aircraft
- Provide PF with an instinctive and immediate procedure to ensure that the PF achieves the best possible result.

Ground mode is a direct relationship between sidestick deflection and elevator deflection.
There is no auto trim. The THS is automatically set at 0 ° (inside the green band). However, when the flight crew enters manually a THS setting to adjust the CG, this one has priority for the take off.
During the take off roll, the system reduces the maximum up elevator deflection from 30 ° to 20 °.

ROTATION MODE

Ident.: DSC-27-20-10-20-00023155.0002001 / 26 OCT 22
Applicable to: MSN 08495-09324, 10949-11139

The objective of the rotation mode is to provide a homogeneous rotation for all possible weight, CG and configurations, while minimizing the risk of a tail strike. The rotation mode is a pitch rate demand control law, providing tail strike protection.
L2 The flight crew can override the tail strike protection.

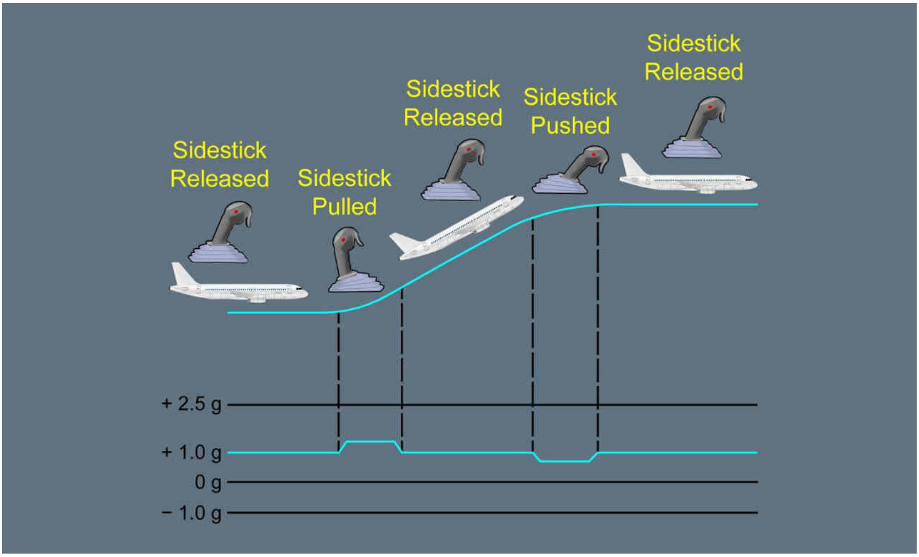
The rotation mode depends on:
- The pitch rate
- The tail clearance
- The sidestick position.

L1 The rotation mode is active from 70 kt during takeoff roll until 10 s after lift-off and pitch attitude is above 8 °.

FLIGHT MODE

2 Ident.: DSC-27-20-10-20-00001070.0007001 / 05 MAY 22
Applicable to: MSN 11531

The normal-law flight mode is a load-factor-demand mode with automatic trim and protection throughout the flight envelope.
Based on normal law, the sidestick controllers set the elevator and THS to maintain the load factor proportional to sidestick deflection and independent of speed.
With the sidestick at neutral, wings level, the system maintains 1 g in pitch (corrected for pitch attitude), and there is no need for the flight crew to trim by changing speed or configuration.
Therefore, if the aircraft deviates from the intended flight path, the flight crew only needs to perform small corrections on the sidestick. If the flight crew senses an overcontrol, the sidestick should be released.



Pitch trim is automatic both in manual mode and when the autopilot is engaged. In normal turns (up to 33 ° of bank) the flight crew must not make any pitch corrections when the turn is established.
The flight mode is active from takeoff to landing, and follows the logic shown schematically (*Refer to DSC-27-20-10-10 General*).

Automatic pitch trim freezes in the following situations:
- The flight crew enters a manual trim order
- The radio height is below 100 ft

- The load factor goes below 0.5 g
- The aircraft is in high-speed or high-Mach protection.

When angle-of-attack protection is active, the THS setting is limited between the setting at entry of the aircraft into this protection and 4 ° nose down. Neither the flight crew nor the system can apply additional nose-up trim.
Similarly, when the load factor is higher than 1.25 g or when the aircraft exceeds 33 ° of bank, the THS setting is limited to values between the current setting and 3.5 ° nose down.

CONTROL WITH AUTOPILOT ENGAGED

- The ELACs and SECs limit what the autopilot can order
- The flight crew must overcome a restraining force to move the sidestick when the autopilot is engaged. If they overcome this force and move the sidestick, they disconnect the autopilot.
- The flight crew can also disconnect the autopilot when they push the rudder pedals (10 ° out of trim), or they move the pitch trim wheel beyond a certain threshold
- All protections of normal laws remain effective except pitch attitude protection.

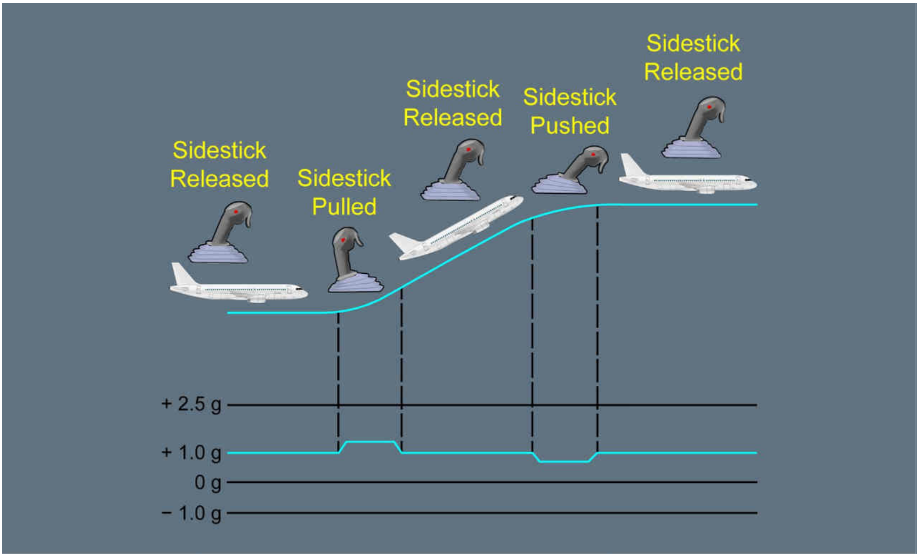
FLIGHT MODE

Ident.: DSC-27-20-10-20-00001070.0004001 / 28 MAY 20

3 **Applicable to: MSN 01855, 04352-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

The normal-law flight mode is a load-factor-demand mode with automatic trim and protection throughout the flight envelope.
Based on normal law, the sidestick controllers set the elevator and THS to maintain the load factor proportional to sidestick deflection and independent of speed.
With the sidestick at neutral, wings level, the system maintains 1 g in pitch (corrected for pitch attitude), and there is no need for the flight crew to trim by changing speed or configuration.
Therefore, if the aircraft deviates from the intended flight path, the flight crew only needs to perform small corrections on the sidestick. If the flight crew senses an overcontrol, the sidestick should be released.

Airbus Pitch Characteristic



Pitch trim is automatic both in manual mode and when the autopilot is engaged. In normal turns (up to 33 ° of bank) the flight crew must not make any pitch corrections when the turn is established. The flight mode is active from takeoff to landing, and follows the logic shown schematically (*Refer to DSC-27-20-10-10 General*).

Automatic pitch trim freezes in the following situations:
- The flight crew enters a manual trim order
- The radio height is below 50 ft (100 ft with autopilot engaged)
- The load factor goes below 0.5 g
- The aircraft is in high-speed or high-Mach protection.

When angle-of-attack protection is active, the THS setting is limited between the setting at entry of the aircraft into this protection and 4 ° nose down. Neither the flight crew nor the system can apply additional nose-up trim.
Similarly, when the load factor is higher than 1.25 g or when the aircraft exceeds 33 ° of bank, the THS setting is limited to values between the current setting and 3.5 ° nose down.

CONTROL WITH AUTOPILOT ENGAGED

- The ELACs and SECs limit what the autopilot can order.
- The flight crew must overcome a restraining force to move the sidestick when the autopilot is engaged. If they overcome this force and move the sidestick, they disconnect the autopilot.

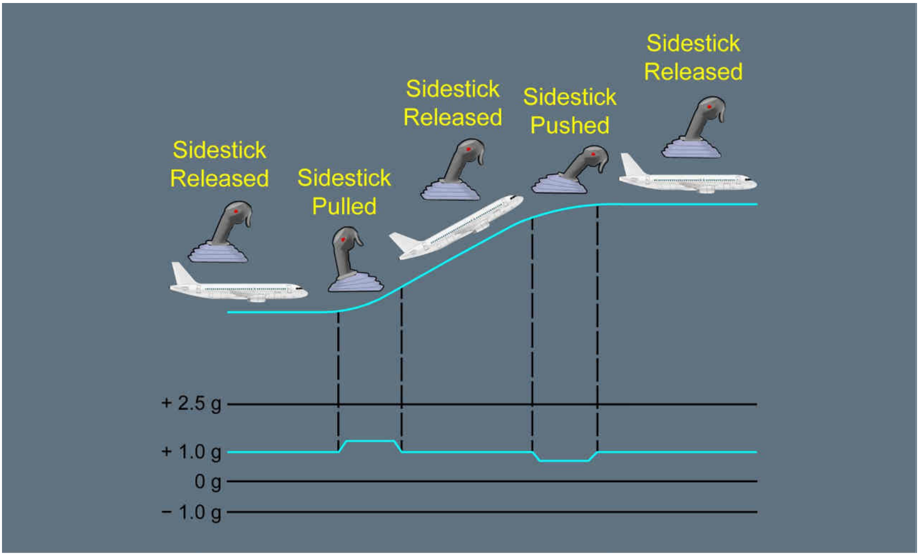
- The flight crew can also disconnect the autopilot when they push the rudder pedals (10 ° out of trim), or they move the pitch trim wheel beyond a certain threshold.
- All protections of normal laws remain effective except pitch attitude protection.

FLIGHT MODE

Ident.: DSC-27-20-10-20-00001070.0001001 / 28 MAY 20
Applicable to: MSN 01801, 01826, 01837, 02321, 02887, 03032, 03222-03229, 03294, 03588-03595, 03710, 03733-04192

The normal-law flight mode is a load-factor-demand mode with automatic trim and protection throughout the flight envelope.
Based on normal law, the sidestick controllers set the elevator and THS to maintain the load factor proportional to sidestick deflection and independent of speed.
With the sidestick at neutral, wings level, the system maintains 1 g in pitch (corrected for pitch attitude), and there is no need for the flight crew to trim by changing speed or configuration.
Therefore, if the aircraft deviates from the intended flight path, the flight crew only needs to perform small corrections on the sidestick. If the flight crew senses an overcontrol, the sidestick should be released.

Airbus Pitch Characteristic



Pitch trim is automatic both in manual mode and when the autopilot is engaged. In normal turns (up to 33 ° of bank) the flight crew must not make any pitch corrections when the turn is established.

The flight mode is active from takeoff to landing, and follows the logic shown schematically (*Refer to DSC-27-20-10-10 General*).

Automatic pitch trim freezes in the following situations:
- The flight crew enters a manual trim order
- The radio height is below 50 ft (100 ft with autopilot engaged)
- The load factor goes below 0.5 g
- The aircraft is in high-speed or high-Mach protection.

When angle-of-attack protection is active, the THS setting is limited between the setting at entry of the aircraft into this protection and 3.5 ° nose down. Neither the flight crew nor the system can apply additional nose-up trim.
Similarly, when the load factor is higher than 1.25 g or when the aircraft exceeds 33 ° of bank, the THS setting is limited to values between the current setting and 3.5 ° nose down.

CONTROL WITH AUTOPILOT ENGAGED

- The ELACs and SECs limit what the autopilot can order.
- The flight crew must overcome a restraining force to move the sidestick when the autopilot is engaged. If they overcome this force and move the sidestick, they disconnect the autopilot.
- The flight crew can also disconnect the autopilot when they push the rudder pedals (10 ° out of trim), or they move the pitch trim wheel beyond a certain threshold.
- All protections of normal laws remain effective except pitch attitude protection.

FLIGHT MODE

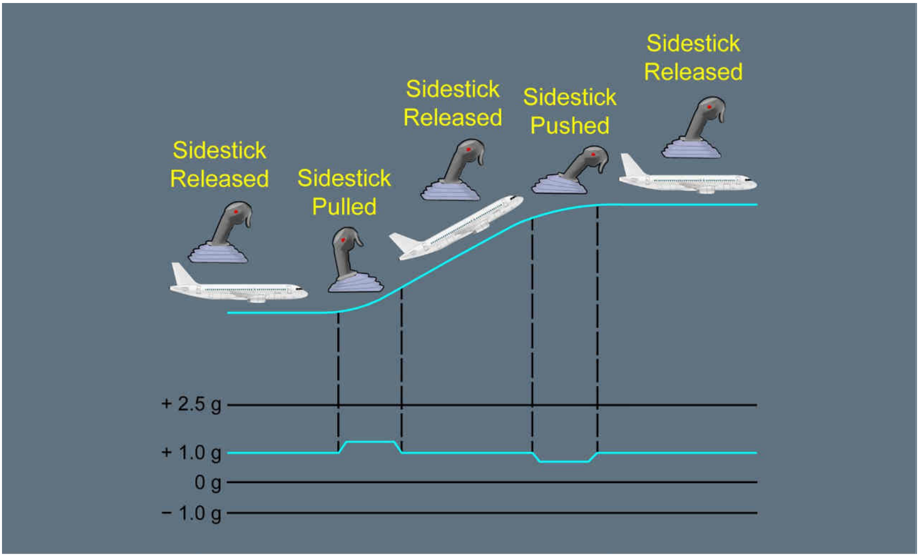
Applicable to: MSN 01143-01518, 01593-01628, 01825, 01832, 02014, 02734, 02896, 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662

4 The normal-law flight mode is a load-factor-demand mode with automatic trim and protection throughout the flight envelope.
Following normal law, the sidestick controllers set the elevator and THS to maintain load factor proportional to stick deflection and independent of speed.
With the sidestick at neutral, wings level, the system maintains 1 g in pitch (corrected for pitch attitude), and there is no need for the flight crew to trim by changing speed or configuration.
Therefore the flight crew only need to perform minor corrections on the sidestick, if the aircraft deviates from its intended flight path. If the flight crew senses an overcontrol, the sidestick should be released.
Pitch trim is automatic both in manual mode and when the autopilot is engaged. In normal turns (up to 33 ° of bank) the flight crew does not have to make any pitch corrections once the turn is established.
The flight mode is active from takeoff to landing, and follows the logic shown schematically (*Refer to DSC-27-20-10-10 General*).

Airbus Pitch Characteristic



Automatic pitch trim freezes in the following situations:
- The flight crew enters a manual trim order.
- The radio height is below 50 ft (100 ft with autopilot engaged).
- The load factor goes below 0.5 g.

When angle-of-attack protection is active, the THS setting is limited between the setting at the aircraft's entry into this protection and 3.5 ° nose down. (Neither the flight crew nor the system can apply additional nose-up trim).
Similarly, when the load factor is higher than 1.25 g or when the aircraft exceeds 33 ° of bank, the THS setting is limited to values between the actual setting and 3.5 ° nose down.
When High Speed or High Mach Protection is active, the THS Setting is limited between the setting at the aircraft's entry into this protection and 11 ° nose-up.

CONTROL WITH AUTOPILOT ENGAGED

- The ELACs and SECs limit what the autopilot can order.
- The flight crew has to overcome a restraining force in order to move the sidestick when the autopilot is engaged. If the flight crew overcomes this force, the flight crew disconnects the autopilot.

- The flight crew can also disconnect the autopilot by pushing on the rudder pedals (10 ° out of trim), or by moving the pitch trim wheel beyond a certain threshold.
- All protections of normal laws remain effective except pitch attitude protection.

FLARE MODE

5 Ident.: DSC-27-20-10-20-00001071.0005001 / 03 NOV 21
Applicable to: MSN 11531

When passing 100 ft RA, the THS is frozen and the normal flight mode changes to flare mode as the aircraft descends to land. The flare mode is a direct stick-to-elevator law without auto trim, with some damping provided by load factor and pitch rate feedback. The flare law provides full elevator authority. The flare law does not compensate the ground or thrust effect.

FLARE MODE

Ident.: DSC-27-20-10-20-00001071.0001001 / 21 MAR 16
6 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

When the aircraft passes 50 ft RA, the THS is frozen and the normal flight mode changes to flare mode as the aircraft descends to land. Flare mode is essentially a direct stick-to-elevator relationship (with some damping provided by the load factor and the pitch rate feedbacks).
The system memorizes the aircraft's attitude at 50 ft, and it becomes the initial reference for pitch attitude control.
As the aircraft descends through 30 ft, the system begins to reduce the pitch attitude to -2 °nose down over a period of 8 s. Consequently, to flare the aircraft, a gentle nose-up action by the pilot is required.

PROTECTIONS

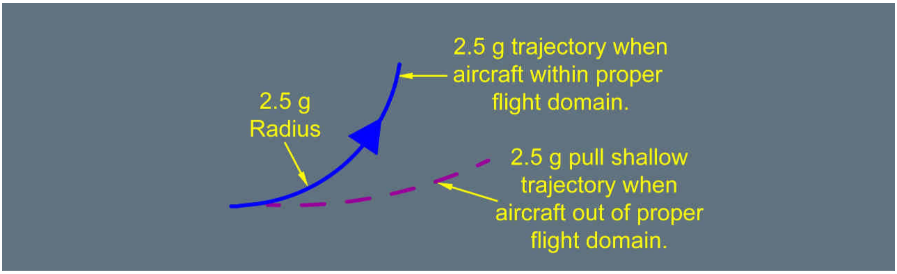
LOAD FACTOR PROTECTION

High load factors can be encountered during evasive maneuvers due to potential collisions, or CFIT ...
Pulling "g" is efficient, if the resulting maneuver is really flown with this "g" number. If the aircraft is not able to fly this trajectory, or to perform this maneuver, pulling "g" will be detrimental.

The load factor is automatically limited to:
- +2.5 g to -1 g for clean configuration.
- +2 g to 0 for other configurations.

Airbus LOAD FACTOR PROTECTION AND SAFETY



2.5 g trajectory when aircraft within proper flight domain.
2.5 g Radius
2.5 g pull shallow trajectory when aircraft out of proper flight domain.

On most commercial aircraft, the potential for an efficient 2.5 g maneuver is very remote. Furthermore, as G Load information is not continuously provided in the cockpit, airline pilots are not used to controlling this parameter. This is further evidenced by inflight experience, which reveals that: In emergency situations, initial PF reaction on a yoke or sidestick is hesitant, then aggressive.

With load factor protection, the PF may immediately and instinctively pull the sidestick full aft: The aircraft will initially fly a 2.5 g maneuver without losing time. Then, if the PF still needs to maintain the sidestick full aft stick, because the danger still exists, then the high AOA protection will take over. Load factor protection enhances this high AOA protection.
Load factor protection enables immediate PF reaction, without any risk of overstressing the aircraft.
Flight experience has also revealed that an immediate 2.5 g reaction provides larger obstacle clearance, than a hesitant and delayed high G Load maneuver (two-second delay).

Ident.: DSC-27-20-10-20-A-00001074.0001001 / 17 MAR 17
Applicable to: ALL

PITCH ATTITUDE PROTECTION

Excessive pitch attitudes, caused by upsets or inappropriate maneuvers, lead to hazardous situations:

- Too high a nose-up ▸ Very rapid energy loss
- Too low a nose-down ▸ Very rapid energy gain

Furthermore, there is no emergency situation that requires flying at excessive attitudes. For these reasons, pitch attitude protection limits pitch attitude:

- 30 ° nose up in conf 0 to 3 (progressively reduced to 25 ° at low speed).
- 25 ° nose up in conf FULL (progressively reduced to 20 ° at low speed).
- 15 ° nose down (indicated by green symbols “=” on the PFD’s pitch scale).

The flight director bars disappear from the PFD when the pitch attitude exceeds 25 ° up or 13 ° down. They return to the display when the pitch angle returns to the region between 22 ° up and 10 ° down.
Pitch attitude protection enhances high speed protection, high load factor protection, and high AOA protection.

Ident.: DSC-27-20-10-20-A-00024137.0001001 / 05 MAY 22
Applicable to: ALL

HIGH ANGLE-OF-ATTACK PROTECTION

In normal law, the aircraft is protected against stall. This protection is also effective in dynamic maneuvers or gusts. When the current AOA becomes greater than αPROT, the high AOA protection activates.
Without flight crew input, the F/CTL computers maintain the AOA equal to αPROT. The AOA can be further increased by flight crew input, up to a maximum value equal to αMAX. When the High AOA protection is activated, the normal law demand is modified and the sidestick input is an AOA demand, instead of a load factor demand.
The flight crew must not deliberately fly the aircraft with a High AOA, except for short periods of time, when maximum High Lift coefficient is required (like during windshear or GPWS maneuvers).

αVLS Angle of attack
corresponding to
minimum allowed speed

Vα PROT, Vα Floor, Vα MAX are mainly computed based on the AOA, and therefore they vary with configuration, weight and load factor (*Refer to DSC-22_10-50-20 Characteristic Speeds*).
The AOA will not exceed αMAX, even if the flight crew gently pulls the sidestick all the way back. The flight crew can hold full back sidestick, if it is needed, and the aircraft stabilizes at an AOA close to but less than the 1 g stall. When flying at αMAX, the flight crew can make gentle turns, if necessary. If the flight crew releases the sidestick, the AOA returns to αPROT and stays there.
As the aircraft enters protection at the amber and black strip (αPROT), the system inhibits further nose-up trim beyond the point already reached. The nose-down trim remains available.

Note: *At takeoff, the αPROT is equal to the αMAX for 5 s.*

This High AOA protection has priority over all other protections.
The aircraft can also enter αPROT at a high flight level, where it protects the aircraft from the buffet boundary. Like in low speed or low flight level, if the sidestick is simply released to neutral, the aircraft maintains the alpha for αPROT. Therefore, when leaving a turn after entering αPROT, the aircraft may climb with the sidestick free.
Alpha for αPROT is reduced as a function of Mach.
If the flight crew flies into αPROT, they should leave it as soon as other considerations allow.
This is achieved by easing forward on the sidestick to reduce alpha below the value of αPROT.
The flight crew should also simultaneously add thrust (if the αFloor has not yet been activated, or cancelled).

Between the αPROT and αMAX, αFloor protection may automatically set the go-around thrust. The αFloor will usually be triggered just after entering αPROT, and the go-around thrust will automatically be applied. Therefore, if the sidestick is held aft, either inadvertently or deliberately, the aircraft will start to climb at a relatively constant low airspeed. To recover a normal flight condition, the αPROT should be exited by easing forward on the sidestick, as described above, and the αFloor should be cancelled by using the instinctive disconnect pushbutton on either thrust lever as soon as a safe speed is regained (*Refer to DSC-22_40-30 Alpha-Floor Protection - General and Activation Conditions*).

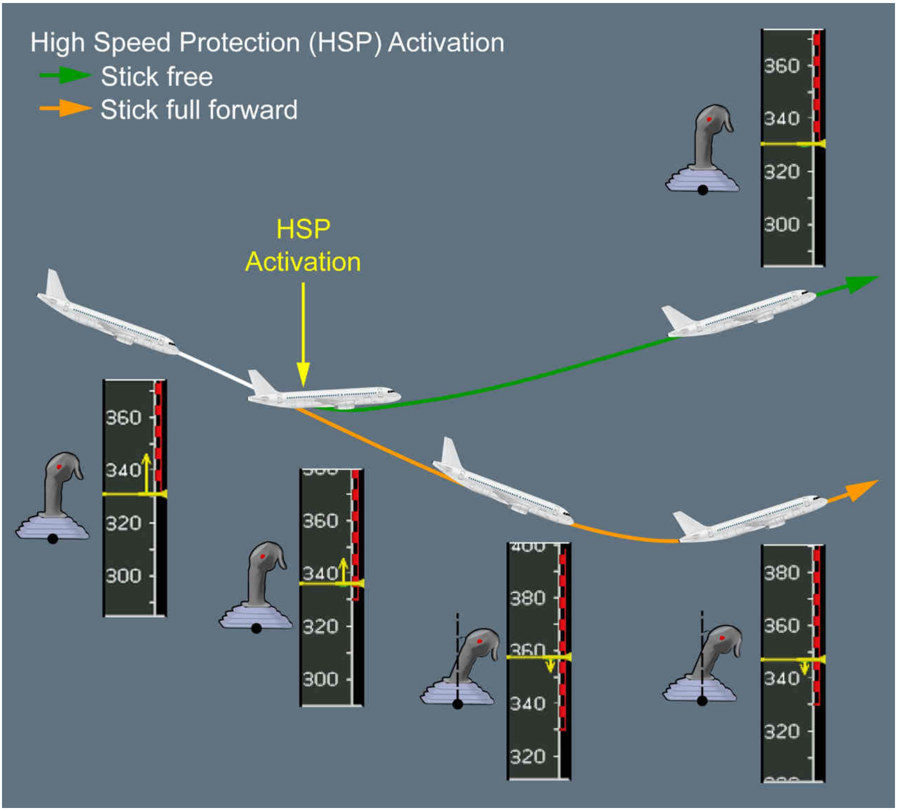
When high speed protection is activated, the THS setting is limited between the setting at the aircraft's entry into this protection and 11 ° nose-up.

Ident.: DSC-27-20-10-20-A-00024651.0001001 / 03 MAY 21
Applicable to: ALL

When high speed protection is activated, positive spiral static stability is introduced to 0 ° bank angle (instead of 33 ° in normal law), so that with the sidestick released, the aircraft always returns to a bank angle of 0 °. The bank angle limit is reduced from 67 ° to 40 °.
As the speed increases above VMO/MMO, the sidestick nose-down authority is progressively reduced, and a permanent nose-up order is applied to aid recovery to normal flight conditions.

Therefore, in a dive situation:

- If there is no sidestick input on the sidestick, the aircraft will slightly overshoot VMO/MMO and fly back towards the envelope
- If the sidestick is maintained full forward, the aircraft will significantly overshoot VMO/MMO. At approximately VMO + 16 kt / MMO + 0.04, the pitch nose-down authority smoothly reduces to zero (which does not mean that the aircraft stabilizes at that speed).



High Speed Protection (HSP) Activation
Stick free
Stick full forward
HSP
Activation

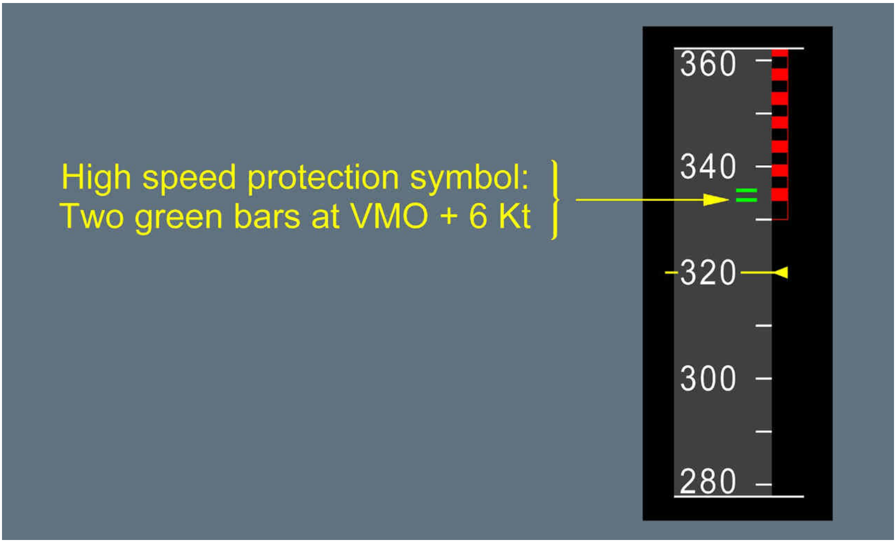
340
320
300
400
380
360
340
320

The PF, therefore, has full authority to perform a high speed/steep dive escape maneuver, when required, via a reflex action on the sidestick.

The high speed protection is deactivated, when the aircraft speed decreases below VMO/MMO, where the usual normal control laws are recovered.

The autopilot disconnects at VMO + 15 kt and MMO + 0.04.



Note: *1. The ECAM displays an overspeed warning at VMO + 4 kt and MMO + 0.006.*
2. At high altitude, this may result in activation of the angle of attack protection. Depending on the ELAC standard, the crew may have to push on the stick to get out of this protection law.

LOW ENERGY AURAL ALERT (IF INSTALLED)

The low energy aural alert is computed by the FAC (*Refer to DSC-22_40-10 General*).

Lateral Control

NORMAL LAW

Ident.: DSC-27-20-10-30-00001078.0006001 / 04 NOV 20

1 **Applicable to: MSN 08495-09324, 10949-11522, 11572-11597**

When the aircraft is on ground, the sidestick commands the aileron and roll spoiler surfaces deflection. The amount of control surface deflection that results from a given amount of sidestick deflection depends upon aircraft speed. The pedals control rudder deflection through a direct mechanical link. The aircraft smoothly transitions to “in flight” mode shortly after liftoff.
When the aircraft is in “in flight” mode, normal law combines control of the ailerons, spoilers (except spoilers 1) and rudder (for turn coordination). The flight crew does not need to use the rudder for turn coordination purpose. While in manual flight the flight crew controls the roll and heading, the flight control system automatically limits the roll rate and the bank angle, ensures turn coordination and damps the dutch roll.
The roll rate requested by the flight crew during flight is proportional to the sidestick deflection, with a maximum rate of:

- 15 °/s in nominal conditions, when the sidestick is in full deflection
- 7.5 °/s in AOA protection or in pitch angle protection, when the sidestick is in full deflection.

During decrab phase, the aircraft limits induced roll after pedal input, in order to ease flight crew control.
After touchdown, the aircraft smoothly transitions from “in flight” mode to “ground” mode.

ENGINE FAILURE AT TAKEOFF

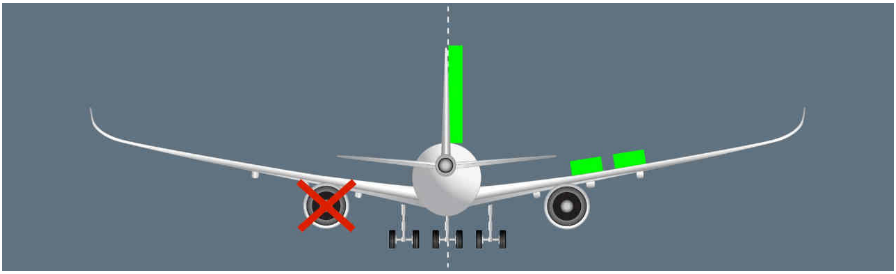
In the case of an engine failure during takeoff, the spoilers 2 and 3 can be deflected on the wing opposite to the failed engine in order to increase yaw efficiency.

Note: *Increasing yaw efficiency in the case of an engine failure on ground, reduces the VMCG, and therefore improves the takeoff performance.*

The spoilers deflection is proportional to the rudder pedal input.

L2 The spoilers will be deflected on the remaining engine side, when:
- The aircraft is on ground
- The pitch attitude is below 2.5 °
- The speed is above 70 kt
- Ground spoilers are not activated
- The rudder pedal order is more than 15 ° of rudder deflection
- AP is not engaged.

Engine failure at takeoff



NORMAL LAW

2 Ident.: DSC-27-20-10-30-00001078.0002001 / 28 MAY 20
Applicable to: MSN 11531

When the aircraft is on the ground (in “on ground” mode), the sidestick commands the aileron and roll spoiler surface deflection. The amount of control surface deflection that results from a given amount of sidestick deflection depends upon aircraft speed. The pedals control rudder deflection through a direct mechanical linkage. The aircraft smoothly transitions to “in flight” mode shortly after liftoff.
When the aircraft is in the “in flight” mode, normal law combines control of the ailerons, spoilers (except N° 1 spoilers), and rudder (for turn coordination). The flight crew does not need to use the rudder for turn coordination. While the system thereby gives the flight crew control of the roll and heading, it also limits the roll rate and bank angle, coordinates the turns, and damps the dutch roll.
The roll rate requested by the flight crew during flight is proportional to the sidestick deflection, with a maximum rate of 15 °/s when the sidestick is at the stop.
During decrab phase, the aircraft will limit induced roll after pedal input, in order to ease flight crew control.
After touchdown, the aircraft smoothly transitions from “in flight” mode to “ground” mode.

NORMAL LAW

When the aircraft is on the ground (in “on ground” mode), the sidestick commands the aileron and roll spoiler surface deflection. The amount of control surface deflection that results from a given amount of sidestick deflection depends upon aircraft speed. The pedals control rudder deflection through a direct mechanical linkage. The aircraft smoothly transitions to “in flight” mode shortly after liftoff.
When the aircraft is in the “in flight” mode, normal law combines control of the ailerons, spoilers (except N° 1 spoilers), and rudder (for turn coordination) in the sidestick. The pilot does not need to

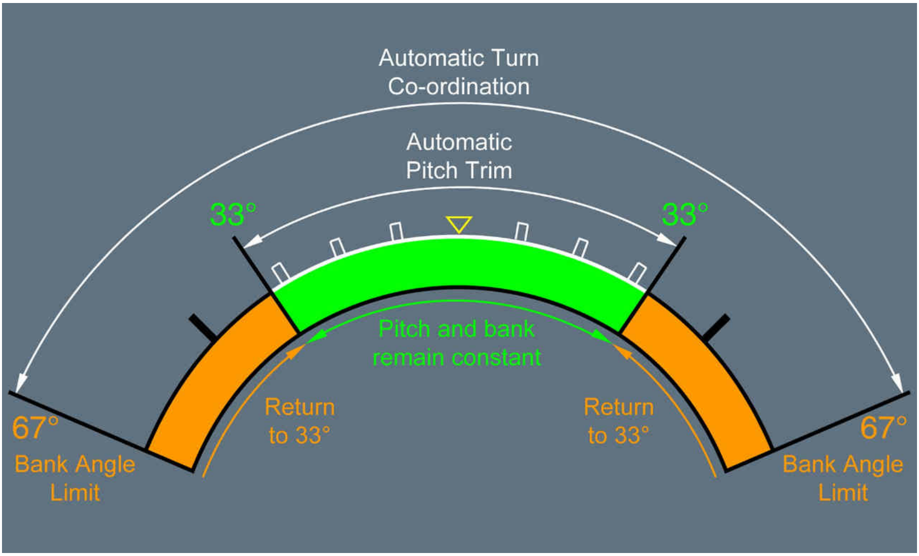
use the rudder for turn coordination. While the system thereby gives the pilot control of the roll and heading, it also limits the roll rate and bank angle, coordinates the turns, and damps the dutch roll.
The roll rate requested by the pilot during flight is proportional to the sidestick deflection, with a maximum rate of 15 °/s when the sidestick is at the stop.
When the aircraft is in “flare” mode, the lateral control is the same as in “in flight” mode.
After touchdown, the aircraft smoothly transitions from “in flight” mode to “ground” mode.

BANK ANGLE PROTECTION

Ident.: DSC-27-20-10-30-00001079.0004001 / 11 MAR 20

3 **Applicable to: MSN 08495-09324, 10949-11522, 11572-11597**

Inside the normal flight envelope, the system maintains positive spiral static stability for bank angles above 33 °. If the flight crew releases the sidestick at a bank angle greater than 33 °, the bank angle automatically reduces to 33 °. Up to 33 °, the system holds the roll attitude constant when the sidestick is at neutral. If the flight crew holds full lateral sidestick deflection, the bank angle goes to 67 ° and no further.
If AOA protection or pitch attitude protection is active, and the flight crew maintains full lateral deflection on the sidestick, the bank angle will not go beyond 45 °. If high speed protection is active, and the flight crew maintains full lateral deflection on the sidestick, the bank angle will not go beyond 40 °. If high speed protection is operative, the system maintains positive spiral static stability from a bank angle of 0 °, so that with the sidestick released, the aircraft always returns to a bank angle of 0 °.
When bank angle protection is active, auto trim is inoperative.
If the bank angle exceeds 45 °, the autopilot disconnects and the FD bars disappear. The FD bars return when the bank angle decreases to less than 40 °.



During a normal turn (bank angle less than 33 °), in level flight:

- The flight crew moves the sidestick laterally (the more the sidestick is moved laterally, the greater the resulting roll rate - e.g. 15 °/s at max deflection)
- It is not necessary to make a pitch correction
- It is not necessary to use the rudder.

In the case of steep turns (bank angle greater than 33 °), the flight crew must apply:

- Lateral pressure on the sidestick to maintain bank
- Aft pressure on the sidestick to maintain level flight.

BANK ANGLE PROTECTION

Ident.: DSC-27-20-10-30-00001079.0001001 / 17 MAR 17

Load Alleviation Function

LOAD ALLEVIATION FUNCTION (LAF)

Ident.: DSC-27-20-10-40-00001080.0006001 / 27 NOV 12

1 **Applicable to: MSN 05342, 05528-05987, 06097, 06121, 06139-09324, 10949-11597**

The load alleviation function permits to alleviate the wing structure loads.

The function is achieved through the upward deflection of:
- The two ailerons only, or
- The two ailerons associated to the spoilers 4 and 5.

The LAF has 2 sub-functions:
- A sub-function activated in case of stable maneuver (ailerons deflections only)
- A sub-function activated in case of gust detection (ailerons and spoilers deflections)

In case of continuous turbulences, the two LAF sub-functions can be activated independently (the highest alleviation is taken into account).
The LAF is available when the aircraft is in clean configuration and in Normal law. The LAF orders are added to those generated by the normal law.

LOAD ALLEVIATION FUNCTION (LAF)

Ident.: DSC-27-20-10-40-00001080.0005001 / 15 FEB 11

Applicable to: MSN 04827-04860

The load alleviation function, which operates through the ailerons, becomes active in turbulence conditions and during maneuvers (pilot control authority is not modified), in order to relieve the wing structure loads.

The LAF becomes active when the vertical load factor exceeds 1.3 g or is below 0.7 g, in this case:
- There is a maximum of 7.5 ° upward deflection (order computed by the ELACs) which is added symmetrically to any aileron deflection.

The load alleviation function is inhibited when:
- Slats or flaps extended, or
- Speed below 210 kt, or
- In direct law, or
- Progressively when the speedbrakes extend.

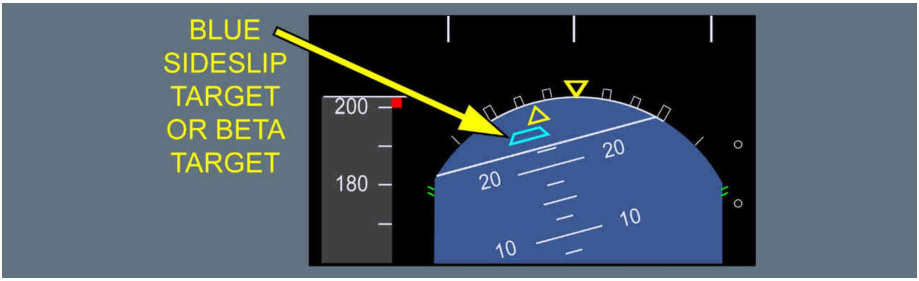
Intentionally left blank

Sideslip Target

SIDESLIP TARGET

Ident.: DSC-27-20-10-50-00001081.0001001 / 17 MAR 17
Applicable to: ALL

If one engine fails, the FAC modifies the sideslip indication slightly to show the pilot how much rudder to use to get the best climb performance (ailerons to neutral and spoilers retracted).
In the case of an engine failure at takeoff, or at go-around, the sideslip index on the PFD changes from yellow to blue (to provide the conditions for the blue display of the sideslip target, *Refer to DSC-31-40 Attitude Data*).



In flight, the lateral normal law commands some rudder surface deflection to minimize the sideslip.
The pilot's response is normal and instinctive: zero the slip indication by applying the right amount of rudder to get the best climb performance.

Intentionally left blank

Aircraft Trimming

AIRCRAFT TRIMMING

Ident.: DSC-27-20-10-70-00002179.0001001 / 09 DEC 09
Applicable to: ALL

When the aircraft is :

- In normal cruise range (around M .77),
- In straight flight,
- With the autopilot engaged,
- With symmetrical engine thrust, and
- With fuel in the wing tanks distributed symmetrically,

the rudder trim should stay between 1 ° right and 2.3 ° left.

Note: *This indication corresponds to a true rudder deflection within ± 1.5 °, taking into account the permanent offset of rudder trim indication, when the aircraft is in cruise conditions. (average 0.5 ° right, 0.8 ° left).*
An indicated, rudder trim above 1 ° right or 2.3 ° left is acceptable, if maintenance personnel establishes that the corresponding real rudder position is within 1.5 ° left, and 1.5 ° right.

Intentionally left blank

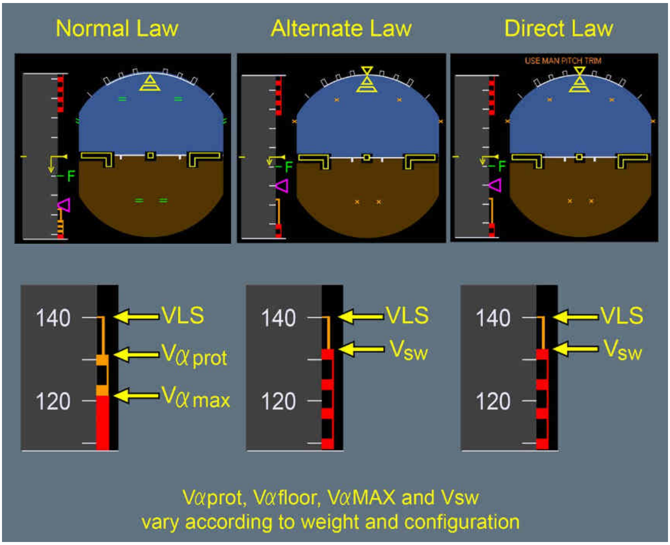
ON THE PFD

The PFD enhances the PF’s awarness of the status of flight controls.
Specific symbols (= in green), and specific formatting of low speed information on the speed scale in normal law, indicate which protections are available.
When protections are lost, amber crosses (X) appear, instead of the green protection symbols (=).
When automatic pitch trim is no longer available, the PFD indicates this with an amber “USE MAN PITCH TRIM” message below the FMA.

Fly-by-Wire Status Awareness via the PFD



Vαprot, Vαfloor, VαMAX and Vsw vary according to weight and configuration

Therefore, by simply looking at this main instrument (PFD), the flight crew is immediately aware of the status of flight controls, and the operational consequences.

(3) *Refer to DSC-27-20-20 Flight Controls Law Reconfiguration*.

PITCH CONTROL

GROUND MODE

Under alternate law the ground mode becomes active on the ground 5 s after touchdown.
It is identical to the ground mode of the normal law.

FLIGHT MODE

In flight, the alternate law pitch mode follows a load-factor demand law much as the normal law pitch mode does, but it has less built-in protection (reduced protections).

FLARE MODE

In pitch alternate law the flight mode changes to the flare mode when the pilot selects landing gear down. The flare mode is a direct stick-to-elevator relationship. (*Refer to DSC-27-20-20 Direct Law*).

LATERAL CONTROL

When the aircraft flying in pitch alternate law, lateral control follows the roll direct law associated with yaw alternate or mechanical.

ROLL DIRECT LAW

Refer to DSC-27-20-20 Direct Law.

YAW ALTERNATE LAW

Only the yaw damping function is available. Damper authority is limited to ±5 ° of rudder deflection.

REDUCED PROTECTIONS

LOAD FACTOR LIMITATION

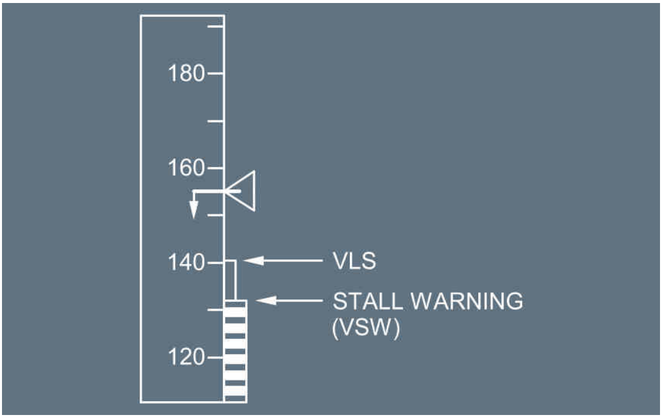
The load factor limitation is similar to that under normal law.

PITCH ATTITUDE PROTECTION

There is no pitch attitude protection. Amber Xs replace the green double bars “=” on the PFD.

LOW SPEED STABILITY

An artificial low speed stability replaces the normal angle-of-attack protection. It is available for all slat/flap configurations, and the low speed stability is active from about 5 kt up to about 10 kt above stall warning speed, depending on the aircraft’s gross weight and slats/flaps configuration.
A gentle progressive nose down signal is introduced, which tends to keep the speed from falling below these values. The pilot can override this demand.
The system also injects bank-angle compensation, so that operation effectively maintains a constant angle of attack.
In addition, audio stall warnings (crickets + “STALL” synthetic voice message) is activated at an appropriate margin from the stall condition.
The PFD speed scale is modified to show a black/red barber pole below the stall warning.
The α floor protection is inoperative.



HIGH SPEED STABILITY

Above VMO or MMO, a nose up demand is introduced to avoid an excessive increase in speed.
The pilot can override this demand.
In addition, the aural overspeed warning (VMO + 4 or MMO + 0.006) remains available.

BANK ANGLE PROTECTION

Not provided.

Note: *The AP will disconnect, if speed exceeds VMO/MMO, or if the bank angle exceeds 45 °.*

(3) *Refer to DSC-27-20-20 Flight Controls Law Reconfiguration*.

PITCH CONTROL

GROUND MODE

Under alternate law, the ground mode becomes active on the ground 5 s after touchdown. It is identical to the ground mode of the normal law.

FLIGHT MODE

In flight, the pith alternate law is similar to the normal law and is based on load factor demand. The flight envelope protections are degraded. The basic high speed protection, pitch attitude protection and angle-of-attack protection are not available.

FLARE MODE

In pitch alternate law, the flight mode changes to the flare mode when the flight crew selects landing gear down. The flare mode is a direct stick-to-elevator relationship (*Refer to DSC-27-20-20 Direct Law*).

LATERAL CONTROL

In alternate law, the lateral control is ensured through a roll direct law and an alternate fly-by-wire or mechanical law.

ROLL DIRECT LAW

Refer to DSC-27-20-20 Direct Law.

YAW ALTERNATE LAW

Only the yaw damping function is available. Damper authority is limited to ±5 ° of rudder deflection.

REDUCED PROTECTIONS

LOAD FACTOR LIMITATION

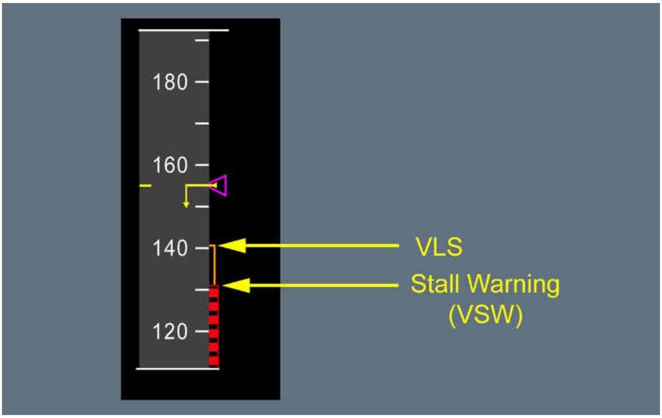
The load factor limitation is similar to the load factor limitation in normal law.

PITCH ATTITUDE PROTECTION

There is no pitch attitude protection. X replaces = on the PFD.

LOW SPEED STABILITY

An artificial low speed stability replaces the normal angle-of-attack protection. It is available for all slat/flap configurations, and the low speed stability is active from about 5 kt up to about 10 kt above stall warning speed, depending on the aircraft's gross weight and slat/flap configuration.
A gentle progressive nose down signal is introduced, that tends to keep the speed from falling below these values. The flight crew can override this demand.
The system also injects bank-angle compensation, so that operation effectively maintains a constant angle of attack.
In addition, stall warnings (crickets + STALL synthetic voice message and STALL STALL message on PFD) are activated at an appropriate margin from the stall condition.
The PFD speed scale is modified to show a black/red barber pole below the stall warning.
The α floor protection is inoperative.



HIGH SPEED STABILITY

Above VMO or MMO, a nose up demand is introduced to avoid an excessive increase in speed.
The flight crew can override this demand.
In addition, the aural overspeed warning (VMO + 4 or MMO + 0.006) remains available.

BANK ANGLE PROTECTION

No bank angle protection is provided. However, both PFDs display the message BANK BANK and "BANK BANK" aural alert is triggered, when the bank angle exceeds 45 °.

Note: *The AP will disconnect, if speed exceeds VMO/MMO, or if the bank angle exceeds 45 °.*

In alternate law, the lateral control is ensured through a roll direct law and an alternate fly-by-wire or mechanical law.

ROLL DIRECT LAW

Refer to DSC-27-20-20 Direct Law.

YAW ALTERNATE LAW

Only the yaw damping function is available. Damper authority is limited to ±5 ° of rudder deflection.

REDUCED PROTECTIONS

LOAD FACTOR LIMITATION

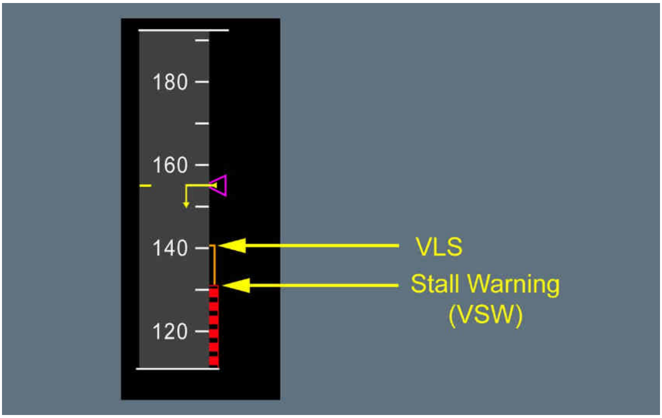
The load factor limitation is similar to the load factor limitation in normal law.

PITCH ATTITUDE PROTECTION

There is no pitch attitude protection. X replaces = on the PFD.

LOW SPEED STABILITY

An artificial low speed stability replaces the normal angle-of-attack protection. It is available for all slat/flap configurations, and the low speed stability is active from about 5 kt up to about 10 kt above stall warning speed, depending on the aircraft’s gross weight and slats/flaps configuration.
A gentle progressive nose down signal is introduced, that tends to keep the speed from falling below these values. The flight crew can override this demand.
The system also injects bank-angle compensation, so that operation effectively maintains a constant angle of attack.
In addition, stall warnings (crickets + STALL synthetic voice message and STALL STALL message on PFD) are activated at an appropriate margin from the stall condition.
The PFD speed scale is modified to show a black/red barber pole below the stall warning.
The α floor protection is inoperative.



HIGH SPEED STABILITY

Above VMO or MMO, a nose up demand is introduced to avoid an excessive increase in speed. The flight crew can override this demand.
In addition, the aural overspeed warning (VMO + 4 or MMO + 0.006) remains available.

BANK ANGLE PROTECTION

No bank angle protection is provided. However, both PFDs display the message BANK BANK when the bank angle exceeds 45 °.

Note: *The AP will disconnect, if speed exceeds VMO/MMO, or if the bank angle exceeds 45 °.*

ALTERNATE LAW WITHOUT REDUCED PROTECTION

Ident.: DSC-27-20-20-00001085.0001001 / 21 MAR 16
Applicable to: ALL

This is identical to alternate law except that it does not include the low-speed stability or the high-speed stability. It includes only the load factor limitation.

DIRECT LAW

Ident.: DSC-27-20-20-00001086.0001001 / 21 MAR 16
Applicable to: ALL

PITCH CONTROL

The pitch direct law is a direct stick-to-elevator relationship (elevator deflection is proportional to stick deflection).

In all configurations the maximum elevator deflection varies as a function of CG.
It is a compromise between adequate controllability with the CG forward, and not-too-sensitive control with the CG aft.
There is no automatic trim : the pilot must trim manually.
The PFD displays in amber the message “USE MAN PITCH TRIM”.
No protections are operative.
The α floor function is inoperative.
Overspeed and stall warnings are available as for alternate law.

LATERAL CONTROL

When flying in “direct law”, the roll direct law associated with mechanical yaw control governs lateral control.

ROLL DIRECT LAW

The roll direct law is a direct stick-to-surface-position relationship. System gains are set automatically to correspond to slat/flap configuration.
With the aircraft in the clean configuration, the maximum roll rate is about 30 °/s.
With slats extended, it is about 25 °/s.
To limit roll rate, the roll direct law uses only ailerons and spoilers N° 4 and 5.
If spoiler N° 4 has failed, spoiler N° 3 replaces it.
If the ailerons have failed, all roll spoilers become active.

YAW MECHANICAL CONTROL

The pilot controls yaw with the rudder pedals.
The yaw damping and turn coordination functions are lost.

ABNORMAL ATTITUDE LAWS

Ident.: DSC-27-20-20-00001087.0004001 / 16 MAY 22
Applicable to: ALL

If for any reason the aircraft goes far outside the normal flight envelope and reaches an extreme attitude, the flight control law will be modified.
The abnormal attitude law will engage and will provide the PF with maximum efficiency to recover normal attitude.

The abnormal attitude law engages when one of the following values is reached:
- Bank angle above 125 °
- Pitch attitude:
  - If at least 2 ADC are valid and consistent: Pitch attitude above 50 ° nose up or below 30 ° nose down
  - In all other cases: Pitch attitude above 40 ° nose up or below 20 ° nose down
- Speed below 70 to 90 kt (depending on the aircraft pitch attitude), or above 440 kt
- Mach above 0.91
- Angle of attack above 40 °.

When the abnormal attitude law engages:
- The pitch alternate law with no protection is active (no load factor limitation)
- The roll direct law is active
- The yaw mechanical law is active
- Autotrim is not available. Therefore, USE MAN PITCH TRIM is displayed on the PFDs
- F/CTL DIRECT LAW is displayed on the ECAM.

When the aircraft returns within the normal flight envelope, the abnormal attitude law disengages and the following conditions remain for the remainder of the flight:
- The pitch alternate law without reduced protection is active, *Refer to DSC-27-20-20 Alternate Law Without Reduced Protection*
- The roll direct law is active
- The yaw alternate law is active
- F/CTL ALTN LAW is displayed on the ECAM.

MECHANICAL BACK-UP

Ident.: DSC-27-20-20-00001088.0001001 / 17 MAR 17
Applicable to: ALL

The purpose of the mechanical backup is to achieve all safety objectives in MMEL dispatch condition: to manage a temporary and total electrical loss, the temporary loss of five fly-by-wire computers, the loss of both elevators, or the total loss of ailerons and spoilers.

PITCH

The pilot manually applies trim to the THS to control the aircraft in pitch.
The PFDs display “MAN PITCH TRIM ONLY” in red.

(1) RUD TRIM rotary selector
Controls the rudder trim actuator, which moves the neutral point of the artificial feel by the equivalent of one degree of rudder travel per second.

Note: The rudder trim rotary selector has no effect, when the autopilot is engaged.

(2) RESET pb
By pushing the RESET pb, the zero trim position is ordered at 1.5 °/s.
After the reset, an indication of up to 0.3° (L or R) may be observed in the rudder trim position indication.

Note: The RESET pb is not active, when the autopilot is engaged.

(3) Position Indicator
Displays the rudder trim direction (L or R) and value.

(4) SPEEDBRAKE lever

The lever controls:
- The position of the speedbrake surfaces.
  To set speedbrake surfaces to a required position, the lever has to be pushed down and set to the required position. A “hardpoint” is provided at “½” SPEEDBRAKE position.
- The manual preselection of the ground spoilers.
  To arm the ground spoilers, the lever must be pulled up when in the RET position.
  When the lever is armed (or reverse thrust is selected), all spoiler's surfaces will automatically extend at landing, or in case of a rejected takeoff.

(5) PITCH TRIM Wheel
Both pitch trim wheels provide mechanical control of the THS and have priority over electrical control. A pilot action on the pitch trim wheel disconnects the autopilot.

Note: Crew action on the pitch trim wheel does not disconnect the ELACs (micro-switches, actuated by the override mechanism, ensure that the computers remain synchronized with the manually-selected position).

The THS is manually-controlled on ground for the THS setting, before takeoff and in flight, when in direct law.

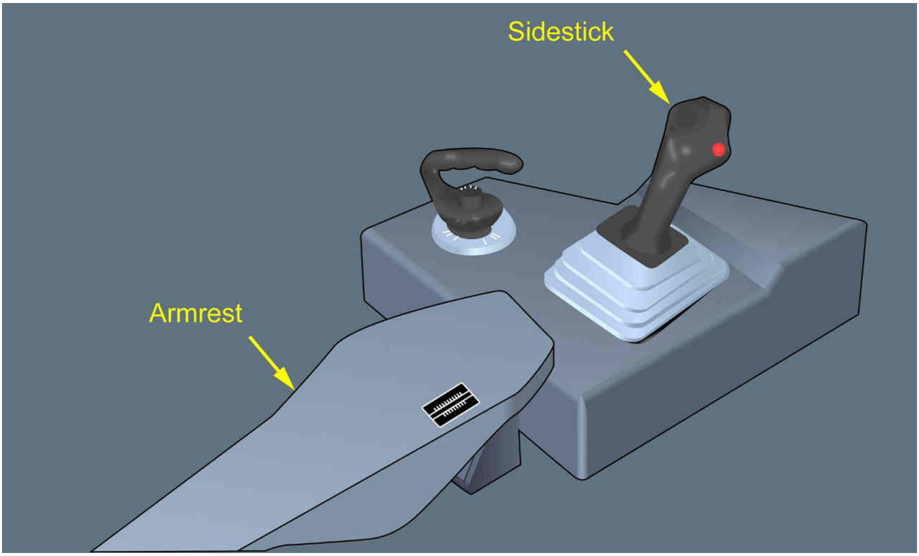
- Before takeoff, the pilot sets the THS to the angular value, determined as a function of the aircraft CG, using the CG scale on the wheel. The relationship between the aircraft CG and the THS setting shown on the trim wheel is only applicable for takeoff. The limits of the THS normal setting range for takeoff are indicated by a green band on the pitch trim wheel.
- In flight, when in direct law, the pilot uses the THS conventionally to fly in trim. In flight, the aircraft pitch trim setting depends on aircraft CG, weight, altitude and speed. Consequently, the relation between the aircraft CG, and the THS setting displayed on the pitch trim wheel, does not apply in flight.

Following nosewheel touchdown, as the pitch attitude becomes less than 2.5 ° for more than 5 s, pitch trim is automatically reset to zero.

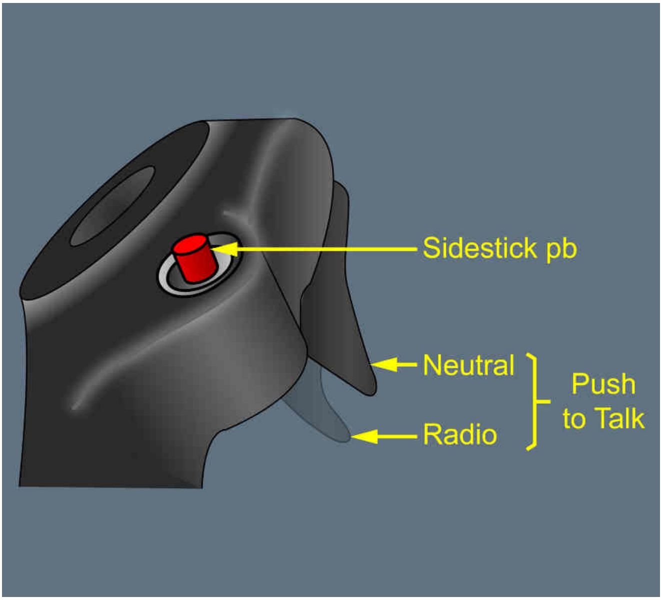
Note: This function is inoperative, when the green or yellow hydraulic system is not pressurized.

LATERAL CONSOLES

Ident.: DSC-27-20-30-00001091.0004001 / 18 MAY 22
Applicable to: ALL



SIDESTICKS



The sidestick are springloaded to neutral. They are not mechanically linked, and do not receive feedback from the flight control surfaces.
When the autopilot is engaged, the sidesticks are locked in the neutral position.

If a flight crewmember applies a force above a given threshold:
- The sidesticks unlock
- The autopilot disengages
- The AUTO FLT AP OFF alert triggers.

L3 The autopilot disengages when a pilot applies a force of more than 5 daN in pitch, or 3.5 daN in roll.

L1 *Note: This is not the recommended method for autopilot disengagement. For more information, Refer to DSC-22_30-30-30 Manual Disengagement 1 and Refer to DSC-22_30-30-30 Automatic Disengagement 1.*

Each sidestick has two controls:
- The Radio Push To Talk switch
- The sidestick pb, for autopilot disengagement, or sidestick priority.

SIDESTICK PRIORITY LOGIC

At all times, only one flight crewmember should fly the aircraft.
However, if both flight crewmembers use their sidesticks simultaneously, their orders are algebraically added.

L2 The flight control laws limit the combined order to the equivalent of the full deflection of one sidestick.

L1 In this case the two green SIDE STICK PRIORITY lights on the glareshield come on and "DUAL INPUT" voice message is activated.
A flight crewmember can deactivate the other sidestick and take full control, by pressing and keeping pressed the sidestick pb.
To deactivate the other sidestick, the flight crewmember must press their sidestick pb for 40s.
The other sidestick is permanently deactivated, until any flight crewmember presses their sidestick pb.
If both flight crew members press their sidestick pb, the last pilot to press gets the priority.

L2 If one sidestick was deactivated on ground, the CONFIG L(R) SIDESTICK FAULT alert is triggered at takeoff power application, or during the TO CONFIG test.

L1 For more information: *Refer to DSC-27-20-30 Glareshield*

ARMREST

The armrest on the sidestick side of the Captain and F/O seats are adjustable.
Correctly adjusting the seat eases the handling of the sidestick.
For information on how to adjust the armrest: *Refer to DSC-25-10-30 Armrest*

(1) SIDE STICK PRIORITY lt

Red arrow light :
- comes on in front of the flight crew losing authority.
- goes out if the flight crew has recovered their authority
  - if the other flight crew releases their TAKEOVER pushbutton prior the priority condition is latched.
    or
  - If the flight crew has used their takeover push button to cancel a latched priority situation.
    Sidestick priority audio : A “PRIORITY LEFT” or “PRIORITY RIGHT” audio voice message is given each time priority is taken.

Green CAPT and F/O lights :

- Both lights flash when the flight crew move both sidesticks simultaneously and neither takes priority.
- When the flight crew has taken priority by pressing the takeover pushbutton and the other flight crew's sidestick is not at neutral, the light in front of the flight crew with priority lights up. It goes out when the other flight crew returns their stick to the neutral position.

(1) ELAC 1(2) pushbutton

Controls the Elevator and Aileron Computer (ELAC) 1(2).

ON : ELAC 1(2) performs the following functions :
- Normal pitch and roll, normal LAF ⊲
- Alternate pitch, alternate LAF ⊲
- Direct pitch and roll
- Abnormal attitude
- Aileron droop
- Acquisition of autopilot orders.

OFF : The corresponding computer is not active. Switching it OFF, then ON, resets the computer.

FAULT : Comes on amber, along with an ECAM caution:
- When a failure is detected
- During ELAC power-up test (eight seconds).

Note: The ELAC power-up test occurs when electrical power is turned on, or after the occurrence of an electrical transient lasting longer than 25 ms.

The FAULT light goes off, when the pilot selects OFF, or at the end of the ELAC power-up test, if its results are satisfactory.

(2) SEC 1(2)(3) pushbutton

Controls the Spoiler and Elevator Computer (SEC) 1(2)(3).

ON : SEC 1(2)(3) performs the following functions:
- Normal roll (by controlling the spoilers)
- Speed brakes and ground spoilers
- Alternate pitch (SEC 1 and SEC 2 only)
- Direct pitch (SEC 1 and SEC 2 only)
- Direct roll
- Alternate LAF ⊲
- Abnormal attitude.

OFF : The corresponding computer is not active. Switching it OFF, then ON, resets the computer.

FAULT : Comes on amber, along with an ECAM caution, when a failure is detected.
The FAULT light goes off, when the pilot selects OFF.

(3) FAC 1(2) pushbutton

Controls the Flight Augmentation Computer (FAC) 1(2).

ON : Both FACs perform the following functions:
- Normal roll (coordinating turns and damping dutch roll)
- Rudder trim
- Rudder travel limit
- Alternate yaw

OFF : The corresponding computer is not active. Switching it OFF, and then ON, resets the computer.

FAULT : Comes on amber, along with an ECAM caution, when a failure is detected.
The FAULT light goes off, when the pilot selects OFF.

- Five slat surfaces and two flap surfaces per wing. These surfaces are electrically controlled and hydraulically operated. The flight crew extends the slats and flaps by moving the flaps lever on the center pedestal. It has five positions.

Ident.: DSC-27-30-10-A-00024877.0001001 / 04 NOV 21
Applicable to: ALL

- Two SFCCs, each containing one slat channel and one flap channel
- A PCU which is made of two independent hydraulic motors coupled by a differential gearbox. The motors use green and blue hydraulic power for the slats, and yellow and green power for the flaps. The POB locks the transmission when the slat or flap surfaces have reached the selected position or if hydraulic power fails.
- An APPU that measures the asymmetry between the left and right wings
- A flap disconnect detection system, which detects attachment failure and inhibits the flap operation in order to prevent further damage. A sensor detects the failure by measuring excessive differential movement between the inner and the outer flaps.
- The WTBs which activate in the case of an uncommanded movement of the surfaces, such as runaway, asymmetry or over speed. They cannot be released in flight. They use blue and green hydraulic power for the slats and for the right wing flaps, and blue and yellow hydraulic power for the left wing flaps.
- The FPPUs that feedback position information to the SFCCs
- An IPPU that sends position data to the ECAM.

Note:
- *If the flap WTB is on, the flight crew can still operate the slats, and if the slat WTB is on, the flight crew can still operate the flaps*
- *If one SFCC is inoperative, both slats and flaps operate at half speed*
- *If one hydraulic system is inoperative, the corresponding surfaces (slats or flaps) operate at half speed.*

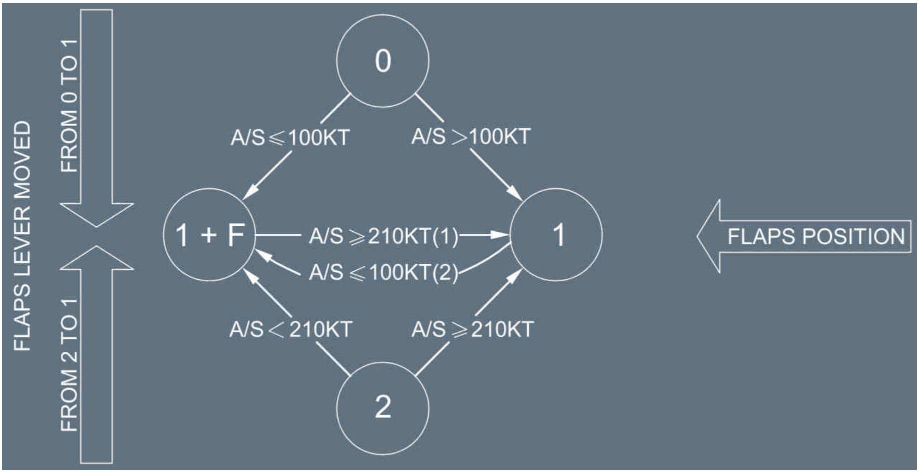
CONFIGURATIONS

Ident.: DSC-27-30-10-00001100.0001001 / 09 OCT 12
Applicable to: ALL

The FLAPS lever has five positions: 0, 1, 2, 3 and FULL.
Two configurations correspond to position 1: Configuration 1 and Configuration 1 + F.
The pilot selects these as follows:



(1) When in Configuration 1 + F, the flaps retract to 0 ° automatically at 210 kt (before the airspeed reaches VFE).

(2) When in configuration 1, the flaps extend to 10 ° automatically at 100 kt.

ALPHA/SPEED LOCK FUNCTION (SLATS)

Ident.: DSC-27-30-10-00001101.0001001 / 13 SEP 16
5 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

This function inhibits slat retraction at high angles-of-attack and low speeds.
The SFCCs use corrected angle-of-attack (alpha) or airspeed information from the ADIRUs to inhibit slat retraction.

When the FLAPS lever is set to 0, the slats alpha/speed lock function activates and inhibits slats retraction, if:

- The AOA is above 8.5 °, or
- The speed is less than 148 kt.

Note: *If the FLAPS lever is already set to 0, when either of the above conditions occurs, the function will not activate therefore the slats will continue to retract or will remain at 0.*

Once the slats alpha/speed lock function is active, the slats retract to 0 when:

- The AOA is less than 7.6 ° and
- The speed is above 154 kt.

Note: *When the aircraft is on ground and its speed is less than 60 kt, then the function will not activate.*

ALPHA/SPEED LOCK FUNCTION (SLATS)

Ident.: DSC-27-30-10-00001101.0002001 / 02 MAY 17

6 **Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

This function inhibits slat retraction at high angles-of-attack and low speeds.
The SFCCs use corrected angle-of-attack (alpha) or airspeed information from the ADIRUs to inhibit slat retraction.

When the FLAPS lever is set to 0, the slats apha/speed lock function activates and inhibits slats retraction, if:

- The AOA is above 8.0 °, or
- The speed is less than 165 kt.

Note: *If the FLAPS lever is already set to 0, when either of the above conditions occurs, the function will not activate therefore the slats will continue to retract or remain at 0.*

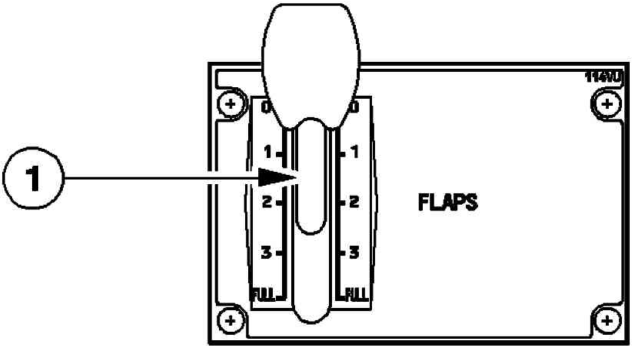
Once the slats alpha/speed lock function is active, the slats retract to 0 when:

- The AOA is less than 7.1 °, or
- The speed is above 171 kt.

Note: *When the aircraft is on ground and its speed is less than 60 kt, then the function will not activate.*

PEDESTAL

1 Ident.: DSC-27-30-20-00001102.0004001 / 03 NOV 21
Applicable to: MSN 11531



(1) FLAPS lever
The FLAPS lever selects simultaneous operation of the slats and flaps.

The five lever positions correspond to the following surface positions :

Position	SLATS	FLAPS	Indications on ECAM			
0	0	0			CRUISE	HOLD
1	18	0	1			
		10	1 + F	TAKEOFF		
2	22	14	2			APPR
3	22	21	3		LDG	
FULL	27	34	FULL			

Before selecting any position, the flight crew must pull the lever out of the detent. Balks at positions 1 and 3 prevent the flight crew from calling for excessive flap/slat travel with a single action.

Note: The flight crew cannot select an intermediate lever position.

TAKEOFF IN CONFIGURATION 1

1 + F (18 °/10 °) is selected. If the flight crew does not select configuration 0 after takeoff, the flaps retract automatically at 210 kt.

TAKEOFF OR GO-AROUND IN CONFIGURATION 2 OR 3

If the flight crew selects configuration 1, the flight crew gets 1 + F (18 °/10 °) if airspeed is under 210 kt.
If the flight crew does not select configuration 0 after takeoff, the flaps retract automatically at 210 kt.

CONFIGURATION 0 TO CONFIGURATION 1 IN FLIGHT

Configuration 1 (18 °/0 °) is selected.

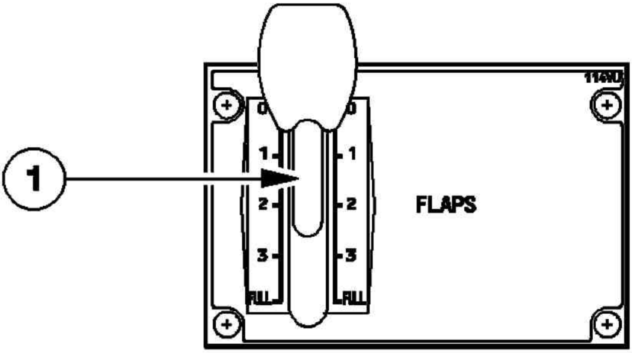
Note: After flap retraction, configuration 1 + F is no longer available until the airspeed is 100 kt or less, unless configuration 2, 3, or FULL has been selected previously.

PEDESTAL

Ident.: DSC-27-30-20-00001102.0001001 / 02 MAY 23

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 04441-04544, 04827-04974, 05066, 05101-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

2



The five lever positions correspond to the following surface positions :

<table>
<tr><th>Position</th><th>SLATS</th><th>FLAPS</th><th>Indications on ECAM</th><th colspan="3"></th></tr>
<tr><td>0</td><td>0</td><td>0</td><td></td><td rowspan="2"></td><td>CRUISE</td><td rowspan="2">HOLD</td></tr>
<tr><td rowspan="2">1</td><td rowspan="2">18</td><td>0</td><td>1</td><td rowspan="3"></td></tr>
<tr><td>10</td><td>1 + F</td><td rowspan="3">TAKEOFF</td><td></td></tr>
<tr><td>2</td><td>22</td><td>15</td><td>2</td><td rowspan="2">APPR</td></tr>
<tr><td>3</td><td>22</td><td>20</td><td>3</td><td rowspan="2">LDG</td></tr>
<tr><td>FULL</td><td>27</td><td>35</td><td>FULL</td><td></td><td></td></tr>
</table>

Before selecting any position, the flight crew must pull the lever out of the detent. Balks at positions 1 and 3 prevent the flight crew from calling for excessive flap/slat travel with a single action.

Note: *The flight crew cannot select an intermediate lever position.*

3 TAKEOFF IN CONFIGURATION 1

1 + F (18 °/10 °) is selected. If the flight crew does not select configuration 0 after takeoff, the flaps retract automatically at 210 kt.

4 TAKEOFF OR GO-AROUND IN CONFIGURATION 2 OR 3

If the flight crew selects configuration 1, the flight crew gets 1 + F (18 °/10 °) if airspeed is under 210 kt.
If the flight crew does not select configuration 0 after takeoff, the flaps retract automatically at 210 kt.

CONFIGURATION 0 TO CONFIGURATION 1 IN FLIGHT

Configuration 1 (18 °/0 °) is selected.

Note: *After flap retraction, configuration 1 + F is no longer available until the airspeed is 100 kt or less, unless configuration 2, 3, or FULL has been selected previously.*

Before selecting any position, the flight crew must pull the lever out of the detent. Balks at positions 1 and 3 prevent the flight crew from calling for excessive flap/slat travel with a single action.

Note: The flight crew cannot select an intermediate lever position.

9

TAKEOFF IN CONFIGURATION 1

1 + F (18 °/10 °) is selected. If the flight crew does not select configuration 0 after takeoff, the flaps retract automatically at 210 kt.

10

TAKEOFF OR GO-AROUND IN CONFIGURATION 2 OR 3

If the flight crew selects configuration 1, the flight crew gets 1 + F (18 °/10 °) if airspeed is under 210 kt.
If the flight crew does not select configuration 0 after takeoff, the flaps retract automatically at 210 kt.

CONFIGURATION 0 TO CONFIGURATION 1 IN FLIGHT

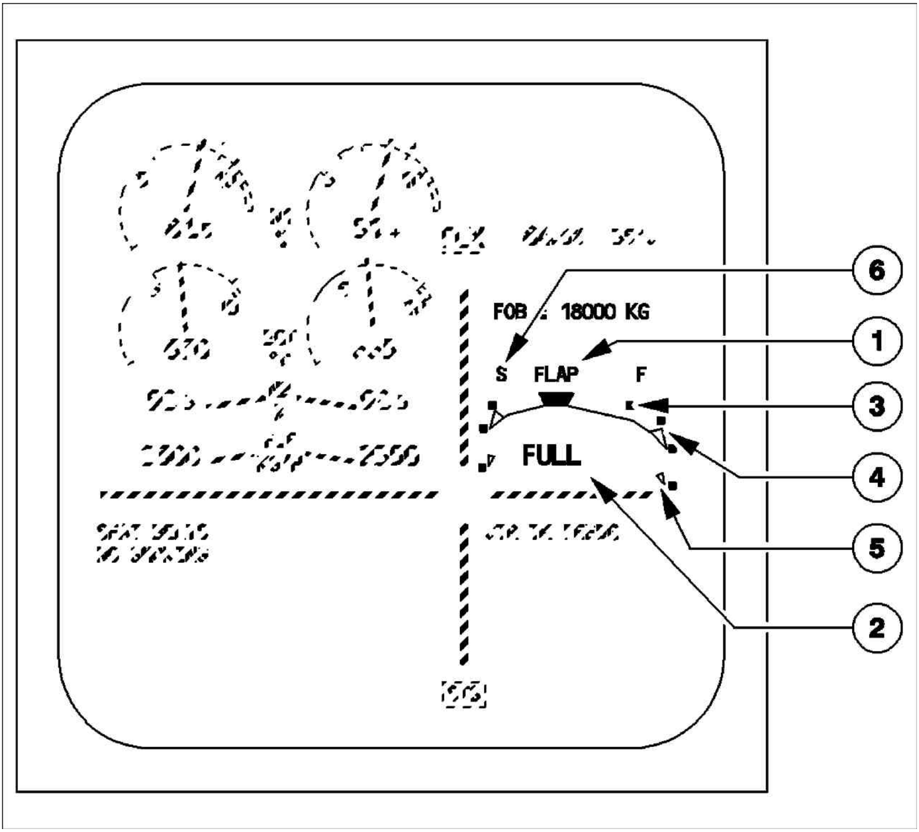
Configuration 1 (18 °/0 °) is selected.

Note: After flap retraction, configuration 1 + F is no longer available until the airspeed is 100 kt or less, unless configuration 2, 3, or FULL has been selected previously.

ECAM UPPER DISPLAY

Ident.: DSC-27-30-20-00001103.0001001 / 18 MAR 11

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321



(1) FLAP indication

The “FLAP” legend appears when the slats or the flaps are not fully retracted.

- The legend is white when the slats and flaps are in the selected position.
- The legend is cyan when the slats and flaps are in transit.
- The legend is amber if:
  - Both relevant hydraulic systems go down (except on the ground with engines stopped).
  - The wingtip brakes are on.
  - There is a fault in the slats or flaps.

(2) Flap lever position

The “0”, “1 + F”, “1”, “2”, “3”, or “FULL” appears.

- It is green, when the slats and flaps are in the selected position. “0” is not displayed, when the aircraft attains clean configuration.
- The legend is cyan when the slats and flaps are in transit.
  The legend “S (F) LOCKED” appears in amber, associated with an ECAM caution, when the wingtip brakes are applied or when the system detects a non-alignment between two flaps.
  The legend “A-LOCK” pulses in cyan when the slat alpha/speed-lock function is active.

(3) Position indexes

These white points indicate that the slats and flaps are in a selectable position. They do not appear when the aircraft is in the clean configuration.

(4) Slat and flap position

These green triangles indicate the actual position of the slats and flaps.

They change to amber if:

- Both relevant hydraulic systems go down, unless the aircraft is on the ground with both engines stopped.
- The wingtip brakes are on.
- There is a fault in the slats or flaps.

(5) Selected surface position

These blue triangles indicate the position the pilot has selected.
(With the current standard display management computer, the blue triangles may disappear before the slats and flaps are all completely in the selected position).

(6) S and F indications

The “S” and “F” normally appear in green. They become amber if:

- Both relevant hydraulic systems go down, unless the aircraft is on the ground with both engines stopped.
- The wingtip brakes are on.
- There is a fault in the slats or flaps.

(1) Position indexes
These white points indicate that the slats and flaps are in a selectable position. They do not appear, when the aircraft is in clean configuration.

(2) F and S

“F” and “S” normally appear in white. They become amber, if:

- Both relevant hydraulic systems fail, unless the aircraft is on ground with both engines stopped.
- The wingtip brakes are on.
- There is a slats or flaps fault.
  “S (F) LOCKED” legend, appears in amber, in association with an ECAM caution, when the wingtip brakes are applied, or when the system detects a non-alignment between two flaps.
  The “A-LOCK” legend pulses in green, when the slat alpha/speedlock function is active.

(3) Flaps/Slats’ actual position
These green boxes indicate the actual flaps/slats position.

They become amber, if:

- Both relevant hydraulic systems fail, unless the aircraft is on ground with both engines stopped.
- The wingtip brakes are on.
- There is a slats or flaps fault.

(4) Selected position
It is in blue, when the surfaces are in transit.
It disappears, when the selected position is reached.

(5) Flap lever position

The “0”, “1 + F”, “1”, “2”, “3”, or “FULL” legend appears.

- It is green, when the slats and flaps are in the selected position. “0” is not displayed, when the aircraft attains clean configuration.
- It becomes cyan, when the slats and flaps are in transit.

The fuel system :
- Stores fuel in the tanks.
- Supplies fuel, in the correct quantities, to the fuel tanks during refueling.
- Supplies fuel to the engines and the Auxiliary Power Unit (APU).
- Circulates fuel to cool the Integrated Drive Generator (IDG).
- Keeps fuel in the outer tanks for wing bending and flutter relief.

TANKS

1 Ident.: DSC-28-10-20-A-00020195.0005001 / 05 JUN 18
Applicable to: MSN 11531

The fuel is stored in the wings, in the center tank, and in the Additional Center Tank (ACT ◁*).
There is a vent surge tank outboard of each wing tank.
When the aircraft has been refueled to maximum capacity, the fuel can expand by 2 % (20 °C temperature rise) without spilling.
There is an overpressure protector in each vent and wing tank, and between the center tank and the left wing tank.

TANK PUMPS

In normal operation each engine is supplied by one pump in the center tank or two pumps in its own side inner tank.
All wing tank pumps remain on throughout the flight. They are fitted with pressure relief sequence valves which ensure that, when all pumps are running, the center tank pumps will deliver fuel preferentially.

INTERTANK TRANSFER VALVES

Two electrical transfer valves are mounted in each wing to permit fuel transfer from outer to inner tank.

Ident.: DSC-28-10-30-A-00001112.0001001 / 10 DEC 09
Applicable to: ALL

CROSS FEED VALVE

A cross feed valve controlled by a double motor allows both engines to be fed from one side or one engine to be fed from both sides.

Ident.: DSC-28-10-30-A-00001113.0001001 / 20 MAR 17
Applicable to: ALL

ENGINE LP VALVES

The engine fuel flow can be stopped by its low pressure (LP) fuel valve. The LP fuel valve is closed by either :

- The engine master switch, or
- The ENG FIRE PUSH pushbutton.

Ident.: DSC-28-10-30-A-00001114.0001001 / 13 NOV 13
6 **Applicable to: MSN 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

SUCTION VALVES

Closed by pumps pressure in normal operation, they allow engines to be fed by gravity if the inner tank pumps fail.

Ident.: DSC-28-10-30-A-00001114.0002001 / 29 MAR 12
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173

SUCTION VALVES

Closed by pumps pressure in normal operation, they allow engines to be fed by gravity if the inner tank pumps fail.

Note: *Center tank pumps are not fitted with suction valves. Therefore, gravity feeding is not possible from the center tank.*

FUEL FEED SEQUENCE

Ident.: DSC-28-10-30-00021263.0001001 / 28 MAY 20

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173

The tanks empty in the following sequence :

1. The ACT2 ◁ : Fuel transfers into the center tank.
2. The ACT1 ◁ : Fuel transfers into the center tank.
3. The center tank.
4. The inner tanks: Each inner tank empties down to 750 kg (1 650 lb).
5. The outer tanks: Fuel transfers into the inner tanks.

CENTER TANK FUEL TRANSFER

The center tank feeds fuel to the engines, when the center tank pumps are not stopped by the control logic described below. The inner tanks feed the engines when the center tank pumps are stopped.

CENTER TANK PUMPS CONTROL LOGIC

Each center tank pump stops, until approximately 500 kg (1 100 lb) of the fuel in its associated inner tank fuel has been used (when the fuel level reaches the underfull sensors).
With the MODE SEL in the MAN position, the center tank pumps will run. In manual mode, the CTR TK PUMP pb-sw must be selected OFF, when the center tank is empty.

FUEL TRANSFER FROM OUTER TO INNER TANKS

The transfer valves automatically open, when the inner tank fuel reaches the low level (about 750 kg/1 650 lb), thus enabling the fuel to drain from the outer to inner tanks.
When open, the valves are latched open. They will automatically close at the next refueling operation.

Note: *1. Two level sensors are installed in each inner tank. Each sensor controls two transfer valves, one in each wing, ensuring simultaneous transfer to both wings.*
2. The 750 kg/1 650 lb value is based on a level aircraft attitude, with no acceleration. During steep descent or accelerations/decelerations, the transfer valves may open with more than 750 kg/1 650 lb of fuel in each inner tank, and the low level warning may be triggered.

IF THE AIRCRAFT HAS ONE ACT ◁ : ACT TO CENTER TANK TRANSFER

ACT transfer automatically starts after takeoff at slats' retraction, if the center tank high-level sensor has been dry for 10 min, and the ACT is not empty.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
When the ACT is empty, the ACT transfer valve, the air shutoff valve and inlet valve close, and the ACT vent valve opens.

Note: *ACT transfer stops, if the center tank high level becomes wet, by closing the ACTs transfer valve. The transfer valve reopens when the center tank high-level sensor becomes dry for 10 min.*

Selecting the ACT pb-sw to FWD opens the ACT transfer valve, the ACT inlet valve, and starts the ACT transfer pump. It must be returned to AUTO, when the ACT is empty.
Center tank overflow is prevented, by returning the ACT pb-sw to AUTO, when the center tank is full.

IF THE AIRCRAFT HAS TWO ACTS ◁ : ACT 1 + 2 TO CENTER TANK TRANSFER

ACT transfer automatically starts after takeoff at slats' retraction, if the center tank high-level sensor has been dry for 10 min, and the ACT is not empty.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
ACT2 transfers first, via the ACT transfer valve and the ACT2 inlet valve.
When ACT2 is empty, the ACT2 inlet valve shuts, and the ACT1 inlet valve opens.
When ACT1 is empty, the ACT transfer valve and ACT1 inlet valve close.
When the aircraft is on ground after landing, the air shutoff valve closes and both ACT vent valves open, depressurizing the ACTs.

Note: *ACT transfer stop, if the center tank high level becomes wet, by closing the ACT transfer valve. The transfer valve reopens when the center tank high-level sensor becomes dry for 10 min.*

Selecting the ACT pb-sw to FWD opens the ACT transfer valve and starts the ACT transfer pump. ACT2 empties first, then ACT1. It must be returned to AUTO, when the ACT is empty.
Center tank overflow is prevented, by returning the ACT pb-sw to AUTO, when the center tank is full.

FUEL FEED SEQUENCE

10 Ident.: DSC-28-10-30-00021263.0013001 / 20 NOV 18
Applicable to: MSN 11531

The wing tanks feed fuel to the engines. The tanks empty in the following sequence:
1. The FWD ACT ◁ : Fuel transfers into the center tank.
2. The AFT2 ACT ◁ : Fuel transfers into the center tank.
3. The AFT1 ACT ◁ : Fuel transfers into the center tank.
4. The center tank: Fuel transfers into the wing tanks.
5. The wing tanks.

CENTER TANK FUEL TRANSFER

The transfer system controls the flow of fuel from the center tank to the wing tanks. The Fuel Level Sensing Control Unit (FLSCU) has automatic control of the transfer valve. When the transfer valve is open, fuel from the wing tank pumps flows through the jet pump and creates a suction in it. This suction moves the fuel from the center tank to the related wing tank.

CENTER TANK TRANSFER VALVE CONTROL LOGIC

The FLSCU automatically closes the associated center tank transfer valve when the wing tank is full. The FLSCU then reopens the center tank transfer valve when the engines have used 250 kg (550 lb) of wing tank fuel (when the fuel level reaches the underfull sensors).

With the MODE SEL in MAN position, the center tank transfer valves will open. Wing tank overflow must be prevented by selecting the CTR TK XFR pb-sw off when the wing tanks are full. They must also be selected off when the center tank is empty.

IF THE AIRCRAFT HAS ONE ACT ◁ : ACT TO CENTER TANK TRANSFER

ACT transfer automatically starts 30 min after landing gear up.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
When the ACT is empty, the ACT transfer valve, the air shutoff valve and inlet valve close, and the ACT vent valve opens.

Note: *ACT transfer stops, if the center tank fuel level exceeds 5 750 kg (12 676 lb), by closing the ACT transfer valve. The transfer valve reopens when the center tank fuel level falls below 5 000 kg (11 023 lb).*

IF THE AIRCRAFT HAS TWO ACTS ◁ : AFT 1 + 2 TO CENTER TANK TRANSFER

ACT transfer automatically starts 30 min after landing gear up.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
AFT2 ACT transfers first, via the ACT transfer valve and the AFT2 ACT inlet valve.
When AFT2 ACT is empty, the AFT2 ACT inlet valve shuts, and the AFT1 ACT inlet valve opens.
When AFT1 ACT is empty, the ACT transfer valve and AFT1 ACT inlet valve close.
When the aircraft is on ground after landing, the air shutoff valve closes and both ACT vent valves open, depressurizing the ACTs.

Note: *ACT transfer stops, if the center tank fuel level exceeds 5 750 kg (12 676 lb), by closing the ACT transfer valve. The transfer valve reopens when the center tank fuel level falls below 5 000 kg (11 023 lb).*

IF THE AIRCRAFT HAS THREE ACTS ◁ : FWD + AFT 2 + AFT 1 TO CENTER TANK TRANSFER

ACT transfer automatically starts 30 min after landing gear up.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
The FWD ACT transfers first, via the ACT transfer valve and the FWD ACT inlet valve.
When FWD ACT is empty, the FWD ACT inlet valve shuts and the AFT2 ACT inlet valve opens.
When AFT2 ACT is empty, the AFT2 ACT inlet valve shuts and the AFT1 ACT inlet valve opens.
When AFT1 ACT is empty, the ACT transfer valve and AFT1 ACT inlet valve close.
When the aircraft is on ground after landing, the air shutoff valve closes and both ACT vent valves open, depressurizing the ACTs.

Note: *ACT transfer stops, if the center tank fuel level exceeds 5 750 kg (12 676 lb), by closing the ACT transfer valve. The transfer valve reopens when the center tank fuel level falls below 5 000 kg (11 023 lb).*

FUEL FEED SEQUENCE

Ident.: DSC-28-10-30-00021263.0010001 / 21 MAR 17

11 **Applicable to: MSN 08495-09324, 10949-11522, 11572-11597**

The inner tanks feed fuel to the engines. The tanks empty in the following sequence :

1. The ACT2 ◁* : Fuel transfers into the center tank.
2. The ACT1 ◁* : Fuel transfers into the center tank.
3. The center tank : Fuel transfers into the inner tanks.
4. The inner tanks : Each inner tank empties down to 750 kg (1 650 lb).
5. The outer tanks : Fuel transfers into the inner tanks.

CENTER TANK FUEL TRANSFER

The transfer system controls the flow of fuel from the center tank to the inner tanks. The Fuel Level Sensing Control Unit (FLSCU) has automatic control of the transfer valve. When the transfer valve is open, fuel from the inner tank pumps flows through the jet pump and creates a suction in it. This suction moves the fuel from the center tank to the related inner tank.

CENTER TANK TRANSFER VALVE CONTROL LOGIC:

The FLSCU automatically closes the associated center tank transfer valve when the inner tank is full. The FLSCU then reopens the center tank transfer valve when the engines have used 500 kg (1 100 lb) of inner tank fuel (when the fuel level reaches the underfull sensors).
With the MODE SEL in MAN position, the center tank transfer valves will open. Inner tank overflow must be prevented by selecting the CTR TK XFR pb-sw OFF when the inner tanks are full. They must also be selected OFF when the center tank is empty.

FUEL TRANSFER FROM OUTER TO INNER TANKS

The transfer valves automatically open, when the inner tank fuel reaches the low level (about 750 kg/1 650 lb), thus enabling the fuel to drain from the outer to inner tanks.
When open, the valves are latched open. They will automatically close at the next refueling operation.

Note:

1. *Two level sensors are installed in each inner tank. Each sensor controls two transfer valves, one in each wing, ensuring simultaneous transfer to both wings.*
2. *The 750 kg/1 650 lb value is based on a level aircraft attitude, with no acceleration. During steep descent or accelerations/decelerations, the transfer valves may open with more than 750 kg/1 650 lb of fuel in each inner tank, and the low level warning may be triggered.*
3. *During takeoff phase with less than 7 000 kg / 15 400 lb FOB, an early outer to inner transfer may occur. This is because one of the wing low-level sensors may become dry due to the move of the fuel in the wing, thus opening the transfer valves.*

IF THE AIRCRAFT HAS ONE ACT ◁ : ACT TO CENTER TANK TRANSFER

ACT transfer automatically starts after takeoff at slats' retraction, if the center tank high-level sensor has been dry for 10 min, and the ACT is not empty.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
When the ACT is empty, the ACT transfer valve, the air shutoff valve and inlet valve close, and the ACT vent valve opens.

Note: *ACT transfer stops, if the center tank high level becomes wet, by closing the ACTs transfer valve. The transfer valve reopens when the center tank high-level sensor becomes dry for 10 min.*

Selecting the ACT pb-sw to FWD opens the ACT transfer valve, the ACT inlet valve, and starts the ACT transfer pump. It must be returned to AUTO, when the ACT is empty.
Center tank overflow is prevented, by returning the ACT pb-sw to AUTO, when the center tank is full.

IF THE AIRCRAFT HAS TWO ACTS ◁ : ACT 1 + 2 TO CENTER TANK TRANSFER

ACT transfer automatically starts after takeoff at slats' retraction, if the center tank high-level sensor has been dry for 10 min, and the ACT is not empty.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
ACT2 transfers first, via the ACT transfer valve and the ACT2 inlet valve.
When ACT2 is empty, the ACT2 inlet valve shuts, and the ACT1 inlet valve opens.
When ACT1 is empty, the ACT transfer valve and ACT1 inlet valve close.
When the aircraft is on ground after landing, the air shutoff valve closes and both ACT vent valves open, depressurizing the ACTs.

Note: *ACT transfer stop, if the center tank high level becomes wet, by closing the ACT transfer valve. The transfer valve reopens when the center tank high-level sensor becomes dry for 10 min.*

Selecting the ACT pb-sw to FWD opens the ACT transfer valve and starts the ACT transfer pump. ACT2 empties first, then ACT1. It must be returned to AUTO, when the ACT is empty.
Center tank overflow is prevented, by returning the ACT pb-sw to AUTO, when the center tank is full.

FUEL FEED SEQUENCE

Applicable to: MSN 06528-06561, 06598, 06634, 06689-06712, 06800-06876

The inner tanks feed fuel to the engines. The tanks empty in the following sequence :
1. The ACT2 ◁✱ : Fuel transfers into the center tank.
2. The ACT1 ◁✱ : Fuel transfers into the center tank.
3. The center tank : Fuel transfers into the inner tanks.
4. The inner tanks : Each inner tank empties down to 750 kg (1 650 lb).
5. The outer tanks : Fuel transfers into the inner tanks.

CENTER TANK FUEL TRANSFER

The transfer system controls the flow of fuel from the center tank to the inner tanks. The Fuel Level Sensing Control Unit (FLSCU) has automatic control of the transfer valve. When the transfer valve is open, fuel from the inner tank pumps flows through the jet pump and creates a suction in it. This suction moves the fuel from the center tank to the related inner tank.

CENTER TANK TRANSFER VALVE CONTROL LOGIC:

The FLSCU automatically closes the associated center tank transfer valve when the inner tank is full. The FLSCU then reopens the center tank transfer valve when the engines have used 500 kg (1 100 lb) of inner tank fuel (when the fuel level reaches the underfull sensors).
With the MODE SEL in MAN position, the center tank transfer valves will open. Inner tank overflow must be prevented by selecting the CTR TK XFR pb-sw OFF when the inner tanks are full. They must also be selected OFF when the center tank is empty.

FUEL TRANSFER FROM OUTER TO INNER TANKS

The transfer valves automatically open, when the inner tank fuel reaches the low level (about 750 kg/1 650 lb), thus enabling the fuel to drain from the outer to inner tanks.
When open, the valves are latched open. They will automatically close at the next refueling operation.

Note: 1. *Two level sensors are installed in each inner tank. Each sensor controls two transfer valves, one in each wing, ensuring simultaneous transfer to both wings.*
2. *The 750 kg/1 650 lb value is based on a level aircraft attitude, with no acceleration. During steep descent or accelerations/decelerations, the transfer valves may open with more than 750 kg/1 650 lb of fuel in each inner tank, and the low level warning may be triggered.*

IF THE AIRCRAFT HAS ONE ACT ◁ : ACT TO CENTER TANK TRANSFER

ACT transfer automatically starts after takeoff at slats' retraction, if the center tank high-level sensor has been dry for 10 min, and the ACT is not empty.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
When the ACT is empty, the ACT transfer valve, the air shutoff valve and inlet valve close, and the ACT vent valve opens.

Note: *ACT transfer stops, if the center tank high level becomes wet, by closing the ACTs transfer valve. The transfer valve reopens when the center tank high-level sensor becomes dry for 10 min.*

Selecting the ACT pb-sw to FWD opens the ACT transfer valve, the ACT inlet valve, and starts the ACT transfer pump. It must be returned to AUTO, when the ACT is empty.
Center tank overflow is prevented, by returning the ACT pb-sw to AUTO, when the center tank is full.

IF THE AIRCRAFT HAS TWO ACTS ◁ : ACT 1 + 2 TO CENTER TANK TRANSFER

ACT transfer automatically starts after takeoff at slats' retraction, if the center tank high-level sensor has been dry for 10 min, and the ACT is not empty.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
ACT2 transfers first, via the ACT transfer valve and the ACT2 inlet valve.
When ACT2 is empty, the ACT2 inlet valve shuts, and the ACT1 inlet valve opens.
When ACT1 is empty, the ACT transfer valve and ACT1 inlet valve close.
When the aircraft is on ground after landing, the air shutoff valve closes and both ACT vent valves open, depressurizing the ACTs.

Note: *ACT transfer stop, if the center tank high level becomes wet, by closing the ACT transfer valve. The transfer valve reopens when the center tank high-level sensor becomes dry for 10 min.*

Selecting the ACT pb-sw to FWD opens the ACT transfer valve and starts the ACT transfer pump. ACT2 empties first, then ACT1. It must be returned to AUTO, when the ACT is empty.

Center tank overflow is prevented, by returning the ACT pb-sw to AUTO, when the center tank is full.

FUEL FEED SEQUENCE

Ident.: DSC-28-10-30-00021263.0003001 / 21 MAR 17

Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

The wing tanks feed fuel to the engines. The tanks empty in the following sequence:

1. The ACT2 ◁ : Fuel transfers into the center tank.
2. The ACT1 ◁ : Fuel transfers into the center tank.
3. The center tank: Fuel transfers into the wing tanks.
4. The wing tanks.

CENTER TANK FUEL TRANSFER

The transfer system controls the flow of fuel from the center tank to the wing tanks. The Fuel Level Sensing Control Unit (FLSCU) has automatic control of the transfer valve. When the transfer valve is open, fuel from the wing tank pumps flows through the jet pump and creates a suction in it. This suction moves the fuel from the center tank to the related wing tank.

CENTER TANK TRANSFER VALVE CONTROL LOGIC

The FLSCU automatically closes the associated center tank transfer valve when the wing tank is full. The FLSCU then reopens the center tank transfer valve when the engines have used 250 kg (550 lb) of wing tank fuel (when the fuel level reaches the underfull sensors).
With the MODE SEL in MAN position, the center tank transfer valves will open. Wing tank overflow must be prevented by selecting the CTR TK XFR pb-sw off when the wing tanks are full. They must also be selected off when the center tank is empty.

IF THE AIRCRAFT HAS ONE ACT ◁ : ACT TO CENTER TANK TRANSFER

ACT transfer automatically starts after takeoff at slats' retraction, if the center tank high-level sensor has been dry for 10 min, and the ACT is not empty.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
When the ACT is empty, the ACT transfer valve, the air shutoff valve and inlet valve close, and the ACT vent valve opens.

Note: *ACT transfer stops, if the center tank high level becomes wet, by closing the ACTs transfer valve. The transfer valve reopens when the center tank high-level sensor becomes dry for 10 min.*

Selecting the ACT pushbutton to FWD opens the ACT transfer valve, the ACT inlet valve, and starts the ACT transfer pump. It must be returned to AUTO, when the ACT is empty.

Center tank overflow is prevented, by returning the ACT pb-sw to AUTO, when the center tank is full.

IF THE AIRCRAFT HAS TWO ACTS ◁ : ACT 1 + 2 TO CENTER TANK TRANSFER

ACT transfer automatically starts after takeoff at slats' retraction, if the center tank high-level sensor has been dry for 10 min, and the ACT is not empty.
Fuel transfers from the ACT to the center tank via pressurization of the tank, by closing the ACT vent valve and opening the air shutoff valve.
ACT2 transfers first, via the ACT transfer valve and the ACT2 inlet valve.
When ACT2 is empty, the ACT2 inlet valve shuts, and the ACT1 inlet valve opens.
When ACT1 is empty, the ACT transfer valve and ACT1 inlet valve close.
When the aircraft is on ground after landing, the air shutoff valve closes and both ACT vent valves open, depressurizing the ACTs.

Note: *ACT transfer stop, if the center tank high level becomes wet, by closing the ACT transfer valve. The transfer valve reopens when the center tank high-level sensor becomes dry for 10 min.*

Selecting the ACT pb-sw to FWD opens the ACT transfer valve and starts the ACT transfer pump. ACT2 empties first, then ACT1. It must be returned to AUTO, when the ACT is empty.
Center tank overflow is prevented, by returning the ACT pb-sw to AUTO, when the center tank is full.

GENERAL

1 Ident.: DSC-28-10-40-00009208.0003001 / 20 NOV 18
Applicable to: MSN 11531

ACT SYSTEM

Up to 3 ACTs can be installed in the cargo holds: 1 FWD, 2 AFT. They transfer to the center tank one at a time, in the following order: FWD then AFT2 and AFT1. Transfer is fully automatic and is achieved by pressurizing the tanks with cabin air.

AUTOMATIC TRANSFER

2 Ident.: DSC-28-10-40-00009209.0007001 / 04 JUN 19
Applicable to: MSN 11531

The transfer starts in flight 30 min after the retraction of the nose landing gear and when the center tank quantity is below 5 000 kg (11 030 lb).
The ACT transfer valve opens and the inlet valve of the first ACT in sequence opens, pressurizing the fuel transfer pipe until that ACT is empty. Each empty ACT is scavenged for around 2 min. Then, its inlet valve closes, and the inlet valve of the next ACT in sequence opens.
When the center tank quantity reaches 5 750 kg (12 700 lb), the ACT transfer stops.
A wire installed on the forward ACT vent pipe detects an ACT damage due to engine rotor burst. Then the forward ACT is automatically isolated.

MANUAL TRANSFER

Applicable to: MSN 11531

3 Ident.: DSC-28-10-40-A-00009210.0001001 / 05 JUN 18

GENERAL

In case of a transfer failure, a manual transfer is performed by pressing the ACT XFR MODE SEL pb-sw . The crew then selects the ACT to be transferred on the ACT XFR rotary selector . If a center tank overflow occurs, pressing the ALL ACT pb-sw stops the ACT transfer by isolating all the ACTs.

For PW 6100 engine: Refer to DSC-70-47 IDG Cooling System.
For PW 1100G engine: Refer to DSC-70-48 IDG Cooling Recirculation System.
Some of the fuel supplied to each engine goes from the high-pressure fuel line in that engine, through the integrated drive generator (IDG) heat exchanger (where it absorbs heat), to the fuel return valve and back to the outer fuel tank.
This operation ensures the IDG cooling when the oil temperature is high or when at low engine power.
The FADEC controls the fuel return valve.
If the outer tank is already full, the fuel overflows to the inner tank through a spill pipe.

Ident.: DSC-28-10-60-B-00020317.0004001 / 17 MAR 17

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173

Refer to DSC-70-40 IDG Cooling System.

Some of the fuel supplied to each engine goes from the high-pressure fuel line in that engine, through the integrated drive generator (IDG) heat exchanger (where it absorbs heat), to the fuel return valve and back to the outer fuel tank.
This operation ensures the IDG cooling when the oil temperature is high or when at low engine power.
The FADEC controls the fuel return valve.
If the outer tank is already full, the fuel overflows to the inner tank through a spill pipe. On ground, the fuel recirculation is not inhibited if there is an overflow in the surge tanks (*Refer to DSC-70-40 IDG Cooling System*).

- **If the FUEL MODE SEL pb-sw is in AUTO mode:**
  If center tank is feeding, the wing tank will tend to overfill and the system automatically selects the CTR TK PUMP off when the inner tank is full. The wing tank pumps will feed until the engine have used approximately 500 kg (1 100 lb) of fuel when the fuel level reaches the underfull sensors. The logic circuits then restart the center tank pumps.
- **If the FUEL MODE SEL pb-sw is in MAN mode:**
  If center tank is feeding, the wing tanks will tend to overfill but the system does not automatically select the CTR TK PUMPs OFF when the inner tank is full. Therefore, an overflow of the wing tanks can occur on ground if the CTR TK PUMPs are not switched OFF.

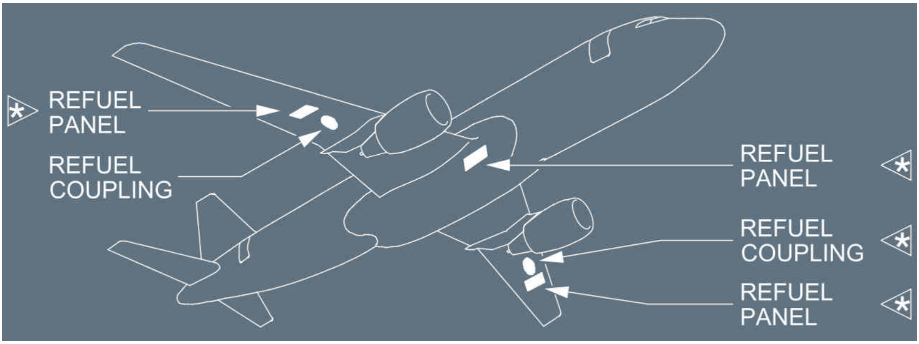
REFUELING - DEFUELING

1 Ident.: DSC-28-10-70-00021235.0010001 / 04 SEP 18
Applicable to: MSN 11531

- During automatic refueling, fuel goes into the ACTs ◁ , the center tank and the wing tanks simultaneously.
  During manual refueling, fill the wing tanks first, then the center tank, then the ACTs ◁ .
- Electrical transients (caused by switching among the APU, the external and the engine electrical supply) during automatic refueling may stop the process. If the automatic refueling process is stopped, it is necessary to re-enter the Preselected Fuel Quantity.
- One (two) refueling point(s) is (are) installed under the wings, enabling the aircraft to be refueled from either the right or left (if installed) side.
- A refuel panel is located on the fuselage side beneath the right wing, or under the right or left wing adjacent to the refuel coupling.



A gallery connects the refuel coupling to each tank's refuel valve.
Refueling is normally automatic, the required fuel load being set on the preselector.
Manual control is also available.
Automatic refueling starts with the wing tanks. If the preselected fuel load exceeds the capacity of the wing tanks, the center tank is simultaneously refueled.
Refuel valves close automatically, when the tanks contain the preselected load, or when sensors detect a high fuel level.
The aircraft can be refueled, when only battery power is available.
The wing tanks can be refueled by gravity, through refueling points on top of the wings.

A transfer valve, between the engine feed system and the refueling gallery, allows :
- The tank pumps to transfer fuel from one tank to another
- Defueling through the refuel coupling.

Approximate refueling time at nominal pressure is :
- 17 min for wing tanks
- 20 min for all tanks (without ACT ◁)
- 25 min for all tanks (with one ACT ◁)
- 27 min for all tanks (with two ACTs ◁)
- 39 min for all tanks (with three ACTs ◁).

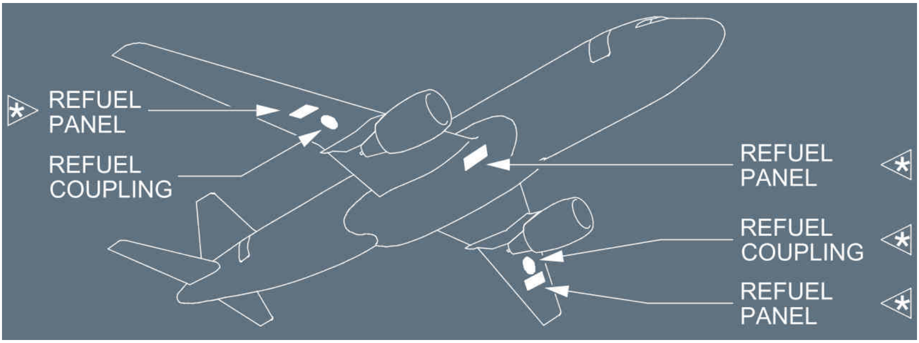
REFUELING - DEFUELING

Ident.: DSC-28-10-70-00021235.0007001 / 21 MAR 17
Applicable to: MSN 06528-06561, 06598, 06634, 06689-06712, 06800-06876

- During automatic refueling, fuel goes into the ACTs ◁ , the center tank and the wing tanks simultaneously.
  During manual refueling, fill the wing tanks first, then the center tank, then the ACTs ◁ .
- Electrical transients (caused by switching among the APU, the external and the engine electrical supply) during automatic refueling may stop the process. If the automatic refueling process is stopped, it is necessary to re-enter the Preselected Fuel Quantity.
- One (two) refueling point(s) is (are) installed under the wings, enabling the aircraft to be refueled from either the right or left (if installed) side.
- A refuel panel is located on the fuselage side beneath the right wing, or under the right or left wing adjacent to the refuel coupling.
- Another refuel panel is located on the cockpit overhead maintenance panel.
- A "READY FOR FUELING" green light is installed adjacent to the refuel coupling.



A gallery connects the refuel coupling to each tank's refuel valve.
Refueling is normally automatic, the required fuel load being set on the preselector.
Manual control is also available.
Automatic refueling starts with the outer tanks. If the selected fuel load exceeds the wing tank capacity, the center tank is simultaneously refueled.
When an outer tank is full, the fuel overflows into the inner tank through a spill pipe.
Refuel valves close automatically, when the tanks contain the preselected load, or when sensors detect a high fuel level.
The aircraft can be refueled, when only battery power is available.
The wing tanks can be refueled by gravity, through refueling points on top of the wings.

A transfer valve, between the engine feed system and the refueling gallery, allows:
- The tank pumps to transfer fuel from one tank to another
- Defueling through the refuel coupling.

Approximate refueling time at nominal pressure is:
- 17 min for wing tanks
- 20 min for all tanks (without ACT ◁)
- 25 min for all tanks (with one ACT ◁)
- 27 min for all tanks (with two ACTs ◁).

FUEL QUANTITY INDICATION (FQI) SYSTEM

Ident.: DSC-28-10-80-00001123.0008001 / 14 JAN 16
Applicable to: MSN 06632, 06658-06685, 06718-06798, 06895-07098

The FQI is a computerized system that :
- transmits the actual total fuel mass, as well as the quantity and temperature of fuel in the tanks, to the ECAM.
- controls automatic refueling.

Two channels perform fuel computations : channel 2 activates automatically if channel 1 fails.

The FQI system has :
- an FQI computer.
- a set of capacitance probes in each tank to measure fuel level.
- sensors in each wing tank to measure fuel temperature.
- devices for measuring fuel characteristics such as density
- a multi tank indicator allowing the quantity for each tank to be displayed on the refuel/defuel panel.

Note: *For low fuel quantities, up to 6 tons (13200 lbs), a fluctuation of the wing tank fuel quantity indications occurs after takeoff. Due to acceleration and high pitch angle, the fuel moves in the tank and the FOB indication will reduce for 2 minutes, then increase and come back to accurate values about 6 minutes later during the climb. The maximum fluctuation may reach 400kg (880lbs). The EFOB indication may turn amber on the MCDU during this phase. In case of go-around, the fluctuation will not be more than 300kg (660lbs).For higher fuel loads, a FOB increase up to a maximum of 1 ton (2200lbs) may occur after takeoff. The FOB indication will come back to its accurate value within a maximum of 6 minutes.*

FUEL QUANTITY INDICATION (FQI) SYSTEM

Ident.: DSC-28-10-80-00001123.0007001 / 14 JAN 16
Applicable to: MSN 06689-06712, 06800-06876

The FQI is a computerized system that :
- transmits the actual total fuel mass, as well as the quantity and temperature of fuel in the tanks, to the ECAM.
- controls automatic refueling.

Two channels perform fuel computations : channel 2 activates automatically if channel 1 fails.

The FQI system has :
- an FQI computer.
- a set of capacitance probes in each tank to measure fuel level and temperature.
- one densitometer (cadensicon) sensor in each wing inner tank permitting the calculation of the fuel quantity.

- one Capacitance Index Compensator (CIC) in each inner tank giving the dielectric constant of the fuel in case of cadensicon failure.
- a quantity indicator for each tank installed on the refuel/defuel panel.
- a preselector on the refuel/defuel panel that shows the preselected and actual total fuel quantity.

Note: *For low fuel quantities, up to 7 tons (15400 lbs), a fluctuation of the inner tank fuel quantity indications occurs after takeoff. Due to acceleration and high pitch angle, the fuel moves in the tank and the FOB indication will reduce for 2 minutes, then increase and come back to accurate values about 6 minutes later during the climb. The maximum fluctuation may reach 400kg (880lbs). The EFOB indication may turn amber on the MCDU during this phase. In case of go-around, the fluctuation will not be more than 300kg (660lbs).For higher fuel loads, a FOB increase up to a maximum of 1 ton (2200lbs) may occur after takeoff. The FOB indication will come back to its accurate value within a maximum of 6 minutes.*

FUEL LEVEL SENSING CONTROL UNIT (FLSCU)

Ident.: DSC-28-10-80-00001124.0001001 / 16 MAR 15

3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

The fuel level system generates fuel-level and fuel-temperature signals in order to operate the appropriate switching functions for refueling and defueling and control the IDG cooling recirculation system and the center-tank-to-wing-tank fuel transfer system.

The FLSCU comprises :
- fuel level sensors in the tanks to sense high, low, and overflow levels.
- a fuel temperature sensor to control the IDG cooling recirculation.

When fuel quantity in one wing tank goes below 750 kg (1 650 lb), the low-level sensor triggers the LO LVL warning on ECAM. The LO LVL warning is totally independent from the displayed fuel quantity indication of the tank.

FUEL LEVEL SENSING CONTROL UNIT (FLSCU)

Ident.: DSC-28-10-80-00001124.0002001 / 16 MAR 15

4 **Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

The fuel level system generates fuel-level and fuel-temperature signals in order to operate the appropriate switching functions for refueling and defueling and control the IDG cooling recirculation system and the center-tank-to-wing-tank fuel transfer system and ACT ◁ to center tank fuel transfer system.

The FLSCU comprises :
- fuel level sensors in the tanks to sense high, low, and overflow levels.
- a fuel temperature sensor to control the IDG cooling recirculation.

When fuel quantity in one wing tank goes below 750 kg (1 650 lb), the low-level sensor triggers the LO LVL warning on ECAM. The LO LVL warning is totally independent from the displayed fuel quantity indication of the tank.

AUXILIARY FUEL MANAGEMENT SYSTEM (AFMS)

5 Ident.: DSC-28-10-80-00009213.0001001 / 05 JUN 18
Applicable to: MSN 11531

The AFMS is a computerized system that:
- Calculates the fuel quantity in the ACTs and transmits the quantities to the ECAM and overhead panel
- Adds the total ACT quantity to the wing and center tank quantity from the FQIC
- Transmits the total fuel quantity to the ECAM
- Controls the transfer of the ACTs to the center tank
- Generates ECAM warnings in case of transfer failure.

The auxiliary fuel management system comprises:
- An AFMC computer
- Two probes in each ACT to measure fuel quantity.

AUXILIARY LEVEL SENSE CONTROL UNIT (ALSCU)

6 Ident.: DSC-28-10-80-00009214.0001001 / 10 DEC 09
Applicable to: MSN 11531

The auxiliary level sense control unit generates ACT low and high fuel level signals in order to control the refuel and transfer of the ACTs. These signals are also used to generate ECAM warnings in case of transfer failure.
The system comprises :

- one ALSCU
- one low level sensor per ACT
- one high level sensor per ACT

FUEL TANK INERTING SYSTEM

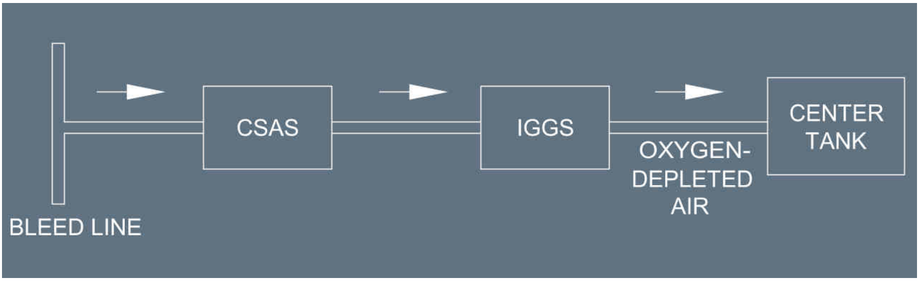
Ident.: DSC-28-10-90-00013692.0001001 / 18 MAR 11

1 **Applicable to: MSN 01628, 01801, 01825-01826, 01832, 01837-01855, 02014, 02734-03032, 03058, 03180-03710, 03761-05987, 06097, 06121, 06139-09324, 10949-11597**

The A318, A319, A320 and A321 aircraft are equipped with a Fuel Tank Inerting System.
The aim of this system is to reduce the flammability in the fuel tanks that have a high flammability exposure.
The fuel center tank is the only one that has a high flammability exposure. Therefore, the Fuel Tank Inerting System only needs to be installed for the center tank. All other tanks do not need Fuel Tank Inerting System installation.
To reduce the flammability in the center tank, the Fuel Tank Inerting System produces an oxygen-depleted air that goes in the center tank to replace the ambient air.

The system is installed in the belly fairing of the aircraft, and is composed by:
- A conditioned Service Air System (CSAS)
- An Inert Gas Generation System (IGGS).

The CSAS extracts and conditions some engine bleed air to adequate pressure and temperature. Then, the air goes through the IGGS where an Air Separation Module taps the nitrogen molecules. Therefore, an oxygen-depleted air is produced (with less than 12 % of oxygen) and replaces the ambient air of the center tank.



The Fuel Tank Inerting System does not require any flight crew action. It works independently as soon as the engines start and until they stop.

Intentionally left blank

CTR TK PUMP 1(2) pb-sw

On : Pump runs, if MAN mode is selected on the MODE SEL pb-sw.
Pump is automatically controlled when AUTO mode is selected.

OFF : Pump is off and OFF button comes on white.

FAULT light : Amber light and associated ECAM caution come on, when the pump is in operation and the delivery pressure drops.

Ident.: DSC-28-20-G-00020257.0001001 / 17 MAR 17
Applicable to: ALL

X FEED pb-sw

ON : The valve opens, and the ON pushbutton comes on in white.

OFF : The valve closes, and the pushbutton does not come on.

OPEN light : This green light comes on, when the valve is fully open.

Ident.: DSC-28-20-G-00020258.0001001 / 17 MAR 17

6 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

ACT pb-sw

AUTO : Control of the ACT transfer is automatic.

- The automatic forward transfer occurs, if:
  - The aircraft is in flight, and
  - The slats are retracted, and
  - At least one ACT low-level sensor is wet, and
  - The center tank high-level sensor has been dry for at least 10 min.
- The automatic forward transfer stops, as soon as one of the above conditions is not met.

FWD : The manual transfer to the center tank is initiated by opening:

- The ACT transfer valve,
- The ACT 1 or ACT 2 (if available) inlet valve.

The ACT transfer pump is then commanded on.

FAULT light : Amber light and associated ECAM caution come on, when:

- The center tank has less than 3 000 kg (6 614 lb) of fuel, and 1 ACT has more than 250 kg (550 lb) of fuel, and
- The ACT pb-sw is on AUTO.

Note: *When no ACT is installed, the pushbutton is inoperative.*

ACT XFR MODE SEL pb-sw

AUTO : Control of the ACTs transfer is automatic.

- Automatic transfer occurs, if:
  - The aircraft is in flight, and
  - The landing gear is up for more than 30 min, and
  - At least one ACT is not empty, and
  - The center tank quantity is below 5 000 kg (11 030 lb).
- The automatic forward transfer stops, when all ACTs are empty, or the center tank quantity is above 5 750 kg (12 700 lb).

MAN : Manual transfer to the center tank is initiated. The ACT transfer and air shutoff valves open, the ACT vent valve closes, and the ACT transfer pump begins to operate.
The inlet valve, of the ACT selected on the ACT XFR selector, opens.

FAULT Light	:	Comes on amber, along with an ECAM caution, when: - The ACT MODE SEL is in AUTO, and - Any ACT empties before the previous ACT is empty. Or - The ACT MODE SEL is in MAN, and - Any of the valves are in the incorrect position.

9 Ident.: DSC-28-20-B-00020262.0002001 / 03 NOV 22

ACT XFR rotary selector

OFF	If the ACT XFR MODE SEL pb-sw is in MAN position, all ACT inlet valves close.
AFT1, AFT2 ◁ , FWD ◁	If the ACT XFR MODE SEL pb-sw is in MAN position, the inlet valve of the selected ACT opens. The selected ACT transfers.

10 Ident.: DSC-28-20-B-00020263.0001001 / 17 MAR 17

ALL ACT pb-sw

Auto	:	The ACT system operates normally.
ISOL	:	The ACT transfer valve closes and the ACT transfer pump stops. ISOL comes on white.
OVFL light	:	Comes on amber when fuel overflows into the left wing surge tank.

FUEL QUANTITY INDICATOR

The number shows the quantity of fuel in each tank.
Units may either be in kg x 1 000 or lb x 1 000 depending on the aircraft configuration.

13 Ident.: DSC-28-20-C-00020279.0001001 / 21 MAR 17

Applicable to: MSN 11531

ACT QUANTITY

The number shows the quantity of fuel in the ACT selected on the ACT selector knob.

14 Ident.: DSC-28-20-C-00020281.0001001 / 21 MAR 17

Applicable to: MSN 11531

TOTAL ACT INDICATOR

The number shows the total fuel quantity of all ACT installed.

Ident.: DSC-28-20-C-00020266.0001001 / 21 MAR 17
Applicable to: ALL

HI LVL light

This blue light comes on, when the system detects a high fuel level.
The corresponding refuel valve closes automatically.

Ident.: DSC-28-20-C-00020267.0001001 / 21 MAR 17
Applicable to: ALL

REFUEL VALVES selector (GUARDED IN NORM)

NORM : Automatic refueling logic controls the refuel valves.

OPEN : Valves open when the MODE SELECT sw is set to the REFUEL or DEFUEL XFR position. Each refuel valve closes, when the system detects a high level in the associated tank.

SHUT : Valves close.

Ident.: DSC-28-20-C-00020268.0001001 / 17 MAR 17
Applicable to: ALL

MODE SELECT sw (GUARDED AT OFF)

OFF : Refuel system is de-energized. Refuel valves are closed.

REFUEL : Refuel valves operate in automatic or in manual mode depending on the position of REFUEL VALVES sw.

DEFUEL XFR : Refuel/Defuel transfer valve opens.
Refuel valve opens if the associated REFUEL VALVE sw is at OPEN.

Ident.: DSC-28-20-C-00020270.0001001 / 21 MAR 17
Applicable to: ALL

OPEN light

This amber light comes on when the defuel transfer valve is open.

Ident.: DSC-28-20-C-00020271.0001001 / 17 MAR 17
Applicable to: ALL

TEST sw

HI LVL : The HI LVL lights come on if high level sensors and associated circuits are serviceable.

Note: If tanks are full (HI LVL lights on) during this test, the HI LVL lights go out if high level sensors and associated circuits are serviceable.

LTS : Lights on panel and all 8's on FQI and preselector come on.

Ident.: DSC-28-20-C-00020272.0001001 / 21 MAR 17
Applicable to: ALL

PRESELECTED DISPLAY

This display shows the preselected total fuel quantity in kg (lb) x 1 000 (multiply by 1 000 to get actual amount).

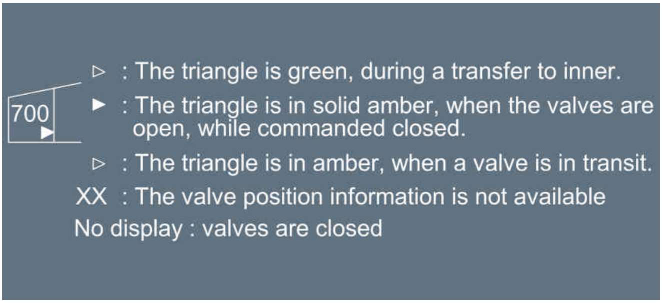
TRANSFER VALVE INDICATIONS

Outer to Inner Transfer



▷ : The triangle is green, during a transfer to inner.

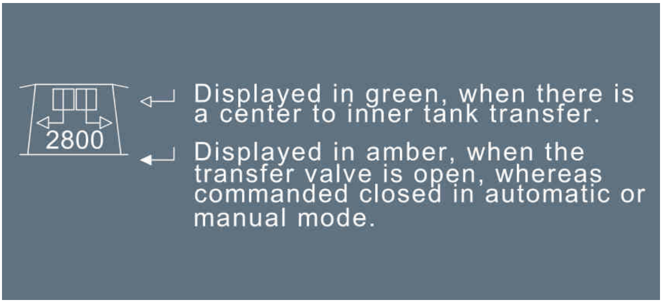
▶ : The triangle is in solid amber, when the valves are open, while commanded closed.

▷ : The triangle is in amber, when a valve is in transit.

XX : The valve position information is not available

No display : valves are closed

Center to Inner Transfer



Displayed in green, when there is a center to inner tank transfer.

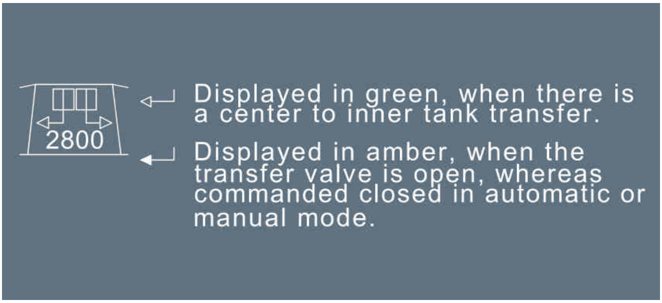
Displayed in amber, when the transfer valve is open, whereas commanded closed in automatic or manual mode.

Ident.: DSC-28-20-F-00020218.0004001 / 17 MAR 17

22 **Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

TRANSFER VALVE INDICATIONS

Center to Inner Transfer



Displayed in green, when there is a center to inner tank transfer.

Displayed in amber, when the transfer valve is open, whereas commanded closed in automatic or manual mode.

Ident.: DSC-28-20-F-00020218.0002001 / 17 MAR 17

TRANSFER VALVE INDICATIONS

One transfer valve is open :
Green : LH or RH inner cell is at low level.
Amber : LH and RH inner cells are not at low level (associated with ECAM caution).

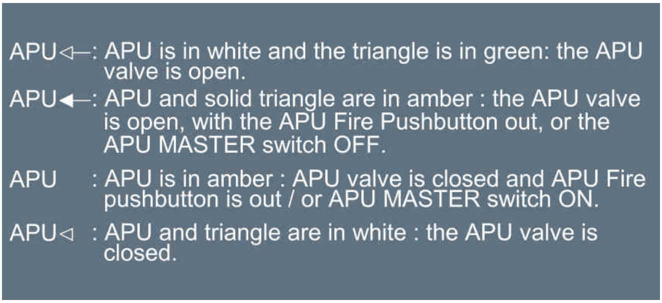
One transfer valve is in transit.

Both transfer valves are closed
Green : LH or RH inner cells are not at low level.
Amber : LH and RH inner cell is at low level (associated with ECAM caution).

Ident.: DSC-28-20-F-00020219.0001001 / 17 MAR 17

23 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

APU INDICATIONS



APU◁—: APU is in white and the triangle is in green: the APU valve is open.

APU◀—: APU and solid triangle are in amber : the APU valve is open, with the APU Fire Pushbutton out, or the APU MASTER switch OFF.

APU : APU is in amber : APU valve is closed and APU Fire pushbutton is out / or APU MASTER switch ON.

APU◁ : APU and triangle are in white : the APU valve is closed.

FUEL TEMPERATURE INDICATION

This appears, when its associated temperature sensor is wet. It is normally in green.

An advisory only appears in phases 2 and 6, when the fuel temperature is:
- Above 45 °C, or
- Below -40 °C.

It becomes amber, and the ECAM displays a caution, if the temperature goes above the high limit or below the low limit.

FUEL ON BOARD (FOB) INDICATION

It is normally in green. It indicates the total of all tanks (Including the ACTs ◁)
Two dashes appear across the last two digits when the FQI is inaccurate (*Refer to DSC-28-20 Total Fuel Indication*).
Units may either be in KG or LB, depending on the DMC pin program.

The indication is boxed in amber, if:
- Center tank pumps fail, or are switched OFF.
- Both transfer valves fail to open, when the inner tank is at low level.
- Any ACT ◁ is not usable.

Ident.: DSC-28-20-F-00020346.0006001 / 17 MAR 17

34 **Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

FUEL ON BOARD (FOB) INDICATION

It is normally in green. It indicates the total of all tanks (Including the ACTs ◁).
Two dashes appear across the last two digits when the FQI is inaccurate (*Refer to DSC-28-20 Total Fuel Indication*).
Units may either be in KG or LB, depending on the DMC pin program.

The indication is half-boxed in amber, if:
- Both center tank transfer valves fail in close position
- Any ACT ◁ is not usable.

Ident.: DSC-28-20-F-00020346.0003001 / 17 MAR 17

35 **Applicable to: MSN 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

FUEL ON BOARD (FOB) INDICATION

It is normally in green. It indicates the total of all tanks (Including the ACTs ◁).
Two dashes appear across the last two digits when the FQI is inaccurate (*Refer to DSC-28-20 Total Fuel Indication*).

Units may either be in KG or LB, depending on the DMC pin program.

The indication is half-boxed in amber, if:
- Center tank pumps fail, or are switched OFF.
- Both transfer valves fail to open, when the inner tank is at low level.
- Any ACT ◁* is not usable.

Ident.: DSC-28-20-F-00020347.0001001 / 17 MAR 17
Applicable to: ALL

FUEL USED INDICATION

- The engine identification number is in amber, when the engine is below idle. It is in white color, when it is at, or above, idle.
- The fuel used indication is green from flight phase 2, until electrical power is cut off at the end of the flight. It is automatically reset, when the engine is started on ground.
- Units may either be in KG or LB, depending on the DMC pin program.

36 Ident.: DSC-28-20-F-00020348.0003001 / 26 SEP 18
Applicable to: MSN 11531

ACT TO CENTER TANK FUEL TRANSFER INDICATION

- The ACTs quantities are each displayed in some grey boxes.
- The box becomes amber in case of a transfer fault.
- The fuel quantity is normally displayed in green.
- The fuel quantity is displayed green pulsing when the crew revert to manual transfer mode and the expected ACT to transfer as per normal sequence is not properly selected on the ACT Control Panel.
- In case of degraded data, the two least significant digits are crossed by an amber line.
- The digital value is replaced by amber XX when the indication is not valid.
- The forward transfer valve is displayed on the transfer line between FWD ACT and CTR TK
  - It is Green (open or closed) when position is in accordance with the command
  - It is Amber (open or closed) when position and command disagree
- A triangle indicates that the fuel transfer to the center tank has started:
  △ : Green, when the automatic transfer begins.
  ▲ : Fully green, when the manual transfer begins.
- The fuel transfer path is displayed in amber in case of failed transfer in AUTO mode.

Ident.: DSC-28-20-F-00020348.0002001 / 17 MAR 17

37 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

ACT TO CENTER TANK FUEL TRANSFER INDICATION

- It is normally in green.
- The ACT quantity is displayed in a grey box.
- This box becomes amber in case of a transfer fault.
- ACT 1 is indicated on the left and ACT 2 is indicated on the right.
- Units may either be in KG or LB, depending on the DMC pin program.
- A triangle indicates that the fuel transfer to the center tank has started:

△	:	Green, when the automatic transfer begins.
▲	:	Fully green, when the manual transfer begins.

ACT TO CENTER TANK FUEL TRANSFER INDICATION

It is normally in green.
A triangle indicates that the ACT fuel transfer to the center tank has started.
The ACT quantity is normally green. It shows the total fuel quantity of ACT(s) installed.
Units may either be in KG or LB, depending on the DMC pin program.
ACT1 is indicated on the left and ACT2 is indicated on the right.

Ident.: DSC-28-20-F-00020351.0001001 / 17 MAR 17

38 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

FUEL FLOW INDICATION

The Total Fuel Flow is displayed in KG/MIN or LB/MIN.
Units may either be in KG or LB, depending on the DMC pin program.

- It is normally in green.
- It is replaced by an amber XX if there is no valid data.

TOTAL FUEL INDICATION

A half amber box appears around FOB, when the displayed quantity is not all usable (intercell transfer valve failure or both center tank transfer valves fail in the closed position).
Units may either be in KG or LB, depending on the DMC pin program.
If the FOB indication is displayed with two dashes across the last two digits, the FQI is in degraded mode. In this case, the ECAM FUEL page can be called on ECAM lower display to determine which tank is affected.

The loss of accuracy resulting from the loss of FQI normal mode is as follows :

Wing outer tank affected	:	+20 kg (+44 lb), –200 kg (–440 lb).
Wing inner tank affected	:	±110 kg (240 lb).
Center tank affected	:	±130 kg (290 lb).
All tanks affected	:	+390 kg (+860 lb), –750 kg (–1660 lb).

Intentionally left blank

GENERAL

Ident.: DSC-29-10-10-00001133.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft has three continuously operating hydraulic systems : blue, green, and yellow. Each system has its own hydraulic reservoir. Normal system operating pressure is 3 000 PSI (2 500 PSI when powered by the RAT). Hydraulic fluid cannot be transferred from one system to another.

Intentionally left blank

GREEN SYSTEM PUMP

Ident.: DSC-29-10-20-00001134.0001001 / 21 MAR 16
Applicable to: ALL

A pump driven by engine 1 pressurizes the green system.

BLUE SYSTEM PUMPS

Ident.: DSC-29-10-20-00001135.0001001 / 21 MAR 16
Applicable to: ALL

An electric pump pressurizes the blue system. A pump driven by a ram air turbine (RAT) pressurizes this system in an emergency.

YELLOW SYSTEM PUMPS

Ident.: DSC-29-10-20-00001136.0001001 / 21 MAR 16
Applicable to: ALL

A pump driven by engine 2 pressurizes the yellow system.
An electric pump can also pressurize the yellow system, which allows yellow hydraulics to be used on the ground when the engines are stopped.
Crew members can also use a hand pump to pressurize the yellow system in order to operate the cargo doors when no electrical power is available.

POWER TRANSFER UNIT (PTU)

Ident.: DSC-29-10-20-00001137.0001001 / 04 DEC 18
Applicable to: ALL

A bidirectional power transfer unit enables the yellow system to pressurize the green system and vice versa.
The power transfer unit comes into action automatically when the differential pressure between the green and the yellow systems is greater than 500 PSI.
The PTU therefore allows the green system to be pressurized on the ground when the engines are stopped.

RAM AIR TURBINE (RAT)

Ident.: DSC-29-10-20-00001138.0001001 / 21 MAR 16
Applicable to: ALL

A drop-out RAT coupled to a hydraulic pump allows the blue system to function if electrical power is lost or both engines fail. The RAT deploys automatically if AC BUS 1 and AC BUS 2 are both lost. It can be deployed manually from the overhead panel. It can be stowed only when the aircraft is on the ground.

SYSTEM ACCUMULATORS

Ident.: DSC-29-10-20-00001139.0001001 / 21 MAR 16
Applicable to: ALL

An accumulator in each system helps to maintain a constant pressure by covering transient demands during normal operation.

PRIORITY VALVES

Ident.: DSC-29-10-20-00001141.0001001 / 21 MAR 16
Applicable to: ALL

Priority valves cut off hydraulic power to heavy load users if hydraulic pressure in a system gets low.

FIRE SHUTOFF VALVES

Ident.: DSC-29-10-20-00001142.0001001 / 21 MAR 16
Applicable to: ALL

Each of the green and yellow systems has a fire shutoff valve in its line upstream of its engine-driven pump. The flight crew can close it by pushing the ENG 1(2) FIRE pushbutton.

LEAK MEASUREMENT VALVES

Ident.: DSC-29-10-20-00001143.0001001 / 21 MAR 16
Applicable to: ALL

Each system has a leak measurement valve upstream of the primary flight controls.
These valves, which measure the leakage in each circuit, are closed by operation of the LEAK MEASUREMENT VALVES pushbutton switch on the maintenance panel.

FILTERS

Ident.: DSC-29-10-20-00001144.0001001 / 21 MAR 16
Applicable to: ALL

L3 Filters clean the hydraulic fluid as follows :
- HP filters on each system and on the reservoir filling system and the normal braking system
- return line filters on each line
- case drain filters on engine pumps and the blue electric pump (which permit maintenance crew to monitor pump wear by inspecting the filters for the presence of metallic particles).

GENERATION

RESERVOIR PRESSURIZATION

Ident.: DSC-29-10-20-00001146.0001001 / 08 FEB 13
Applicable to: ALL

Normally, HP bleed air from engine 1 pressurizes the hydraulic reservoirs automatically.
If the bleed air pressure is too low, the system takes bleed air pressure from the crossbleed duct.
The systems maintain a high enough pressure to prevent their pumps from cavitating.

(1) ENG 1 (2) PUMP pb

On	:	The pump pressurizes the system when the engine is running.
OFF	:	The pump is depressurized. The generation of hydraulic power stops.

FAULT lt : This amber light comes on, and the ECAM caution appears, if :
- The reservoir level is low
- The reservoir overheats
- The reservoir air pressure is low
- The pump pressure is low (inhibited on the ground, when the engine is stopped).

This light goes out, when the crew selects OFF, except during an overheat. (The light stays on as long as the overheat lasts).

(2) BLUE ELEC PUMP pb (guarded)

AUTO : If AC power is available, the electric pump operates :
- In flight
- On the ground, if one engine is running or if the crew has pressed the BLUE PUMP OVRD pushbutton on the maintenance panel.

OFF : The pump is de-energized.

FAULT lt : This amber light comes on, and a caution appears on the ECAM, if :
- The reservoir level is low
- The reservoir overheats
- The air pressure in the reservoir is low
- The pump is delivering low pressure (inhibited on the ground, when the engines are stopped)
- The pump overheats.

The light goes out, when the crew selects OFF, except during an overheat. (The light stays on as long as the overheat lasts).

(3) YELLOW ELEC PUMP pb sw (springloaded)

ON : The electric pump is ON.
If the electrical power supply is removed, the pump will remain off when electrical power is applied again.

Off : The pump is off.
It comes on automatically when a crewman sets the lever of the cargo door manual selector valve to OPEN or CLOSE.
This inhibits the operation of other yellow system functions (except alternate braking and engine 2 reverse).

FAULT lt : This amber light, accompanied by an ECAM caution, comes on if :
- the reservoir level is low
- air pressure in the reservoir is low
- the reservoir overheats
- pump pressure is low
- the pump overheats.

The light goes out when the crew selects OFF, except during an overheat. (The light stays on as long as the overheat lasts).

(4) PTU pb sw

AUTO : The bidirectional power transfer unit is armed and both the yellow and the green electrohydraulic valves are open.
The power transfer unit runs automatically when the differential pressure between the green and yellow systems is more than 500 PSI.

Note: *The PTU is inhibited during the first engine start and automatically tested during the second engine start.*

OFF : Both the green and the yellow PTU electrohydraulic valves close. Power transfer stops.

FAULT lt : This amber light comes on, and a caution appears on the ECAM, if :
- the green or the yellow reservoir overheats
- the green or the yellow reservoir has low air pressure
- the green or the yellow reservoir has a low flluid level.

The light goes out when the crew selects OFF, except during an overheat. (The light stays on as long as the overheat lasts).

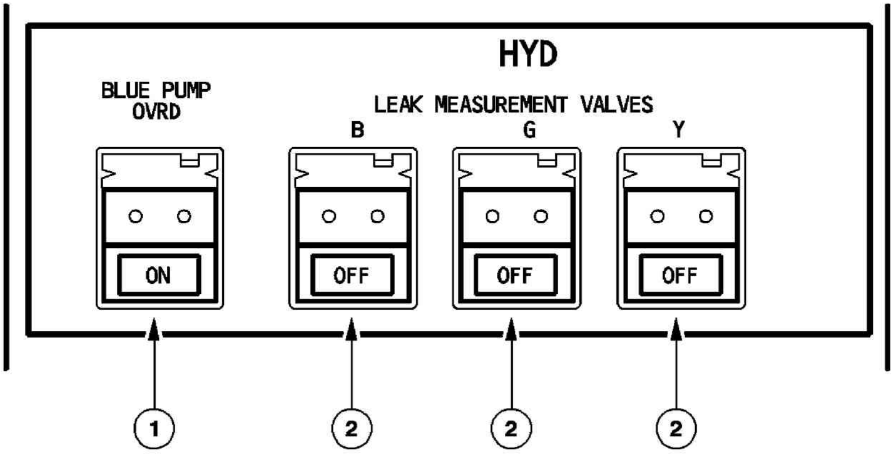
(5) RAT MAN ON pb

The flight crew may extend the RAT at any time by pressing the RAT MAN ON pushbutton.

Note: *The RAT extends automatically if AC BUS 1 and AC BUS 2 are lost. (Refer to DSC-24-20 Overhead Panel (Cont'd)).*

MAINTENANCE PANEL

Ident.: DSC-29-20-00001150.0001001 / 21 MAR 16
Applicable to: ALL



(1) BLUE PUMP OVRD pb sw (guarded)

ON : The blue electric pump is on if the ELEC PUMP pushbutton switch on the HYD panel is at AUTO.

Off : The blue electric pump is off.

(2) LEAK MEASUREMENT VALVES pb sw (guarded)

OFF : The corresponding electrohydraulic valve closes and shuts off hydraulic supply to the primary flight controls.

On : The corresponding electrohydraulic valve opens to go back to normal hydraulic supply.

LOW LEVEL WARN

(2) Reservoir LO AIR PRESS
This appears in amber, and a caution appears on ECAM, if the air pressure for the indicated reservoir drops below normal.

(3) Reservoir OVHT
This appears in amber, and a caution appears on ECAM, if the temperature of returning hydraulic fluid temperature at the inlet to its reservoir is above normal.

(4) FIRE VALVE

Cross line - Amber : The valve is fully closed.

In line - Green : The valve is not fully closed.

(5) OVHT
This appears in amber if the electric pump for that system (blue or yellow) overheats.

(6) RAT

RAT ▷ White : The RAT is stowed.

RAT◼ Green : The RAT is not stowed.

RAT ▶ Amber : Pressure for stowing the RAT has been applied, or the RAT pump is not available.

(7) ELEC
This legend, normally white, becomes amber if the associated power supply fails.

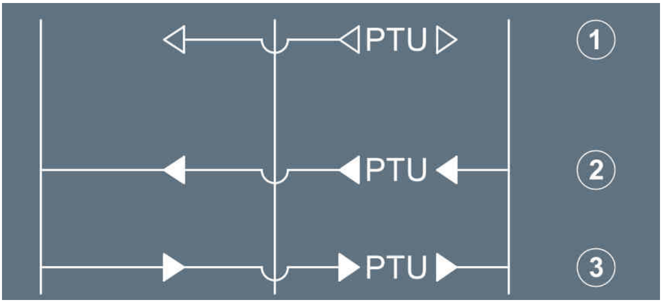
(8) YELLOW ELEC PUMP control

◁ White : The electric pump is off.

◼ Green : The electric pump is ON.

◄ Amber : The electric pump is ON and the yellow system has low pressure.

(9) PTU control



(1)

Green : The power transfer unit (PTU) pushbutton switch is in AUTO and the PTU is not transferring pressure.

Amber : The PTU pb-sw is OFF.

(2)

Green : The PTU is supplying the green hydraulic system.

(3)

Green : The PTU is supplying the yellow hydraulic system.

(10) ENG PUMP control and low pressure indication

In line (Green) : The pushbutton switch for the designated PUMP is on and hydraulic pressure is normal.

Cross line (Amber) : The pushbutton switch for the designated PUMP is OFF.

“LO” (Amber) : The pushbutton switch for the designated PUMP is on and hydraulic pressure is low.

(11) System label

	pressure > 1 450 PSI	**pressure < 1 450 PSI**
YELLOW	white	amber
△	green	amber

(12) System pressure
This legend, normally green, becomes amber when system pressure is below 1 450 PSI.

(13) PUMP

This legend, normally white, becomes amber when N2 is below idle.

DESCRIPTION

Ident.: DSC-30-20-10-00017417.0001001 / 21 MAR 16
Applicable to: ALL

In flight, hot air from the pneumatic system heats the three outboard slats (3-4-5) of each wing.
Air is supplied through one valve in each wing.
The WING pushbutton on the ANTI ICE panel controls the valves.
When the aircraft is on ground, the flight crew can initiate a 30 s test sequence by turning the system ON.
If the system detects a leak during normal operation, the affected side's wing anti-ice valve automatically closes (*Refer to DSC-36-10-50 Leak Detection*).
When wing anti-ice is selected, the N1 or EPR limit is automatically reduced, and the idle N1 or EPR is automatically increased.
If the electrical power supply fails, the valves close.

WING A.ICE : This memo appears in green, if the WING ANTI ICE pb-sw is ON.

DESCRIPTION

Ident.: DSC-30-30-10-00017422.0001001 / 21 MAR 16

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

An independent air bleed from the high pressure compressor protects each engine nacelle from ice.
Air is supplied through a two-position (open and closed) valve that the flight crew controls with two pushbuttons, one for each engine.
The valve automatically closes, if air is unavailable (engine not running).
When an engine anti-ice valve is open, the N1 or EPR limit is automatically reduced and, if necessary, the idle N1 or EPR is automatically increased for both engines in order to provide the required pressure.
If electrical power fails, the valves open.

DESCRIPTION

Ident.: DSC-30-30-10-00017422.0002001 / 04 JUL 17

1 **Applicable to: MSN 08495-09324, 10949-11597**

Each engine has its own anti-ice system, with an independent hot bleed air source.

L3 The bleed air is extracted from the High Pressure Compressor to anti-ice the engine air inlet.

L1 Two Pressure Regulated & Shut off Valves (PRSOV) enable the flow of bleed air to the engines air intake inlet.

Each valve is electrically controlled and pneumatically actuated.

L2 Both PRSOVs are regulating in cascade when the engine anti-ice is on.

L1 Only one PRSOV is performing the shut off function when the engine anti-ice is off.

A continuous monitoring of the system enables the detection of bleed air duct leak or burst and deactivation of the system.

When the engine anti-ice is on, the N1 limit is automatically reduced and the idle N1 is automatically increased for both engines, if necessary, in order to provide the required pressure.

In the case of a detected burst duct, both valves are commanded closed.

In the case of an electrical failure, both PRSOVs are fail safe opened providing the air inlet with enough pressure for the anti-ice function.

Intentionally left blank

DESCRIPTION

Ident.: DSC-30-40-10-00017458.0001001 / 15 NOV 22
Applicable to: ALL

The aircraft uses electrical heating to anti-ice each windshield and defog the cockpit side windows. Two independent WHC, one on each side, automatically regulates the system, protects it against overheating, and indicates faults.

Window heating comes ON:
- Automatically when at least one engine is running, or when the aircraft is in flight
- Manually before engine start, when the flight crew switches ON the PROBE/WINDOW HEAT pb-sw.

The windshield heating operates at low power on ground and at normal power in flight. The changeover is automatic.
Only one heating level exists for the windows.

Intentionally left blank

OVERHEAD PANEL

DESCRIPTION

Ident.: DSC-30-50-10-00017459.0001001 / 21 MAR 16
Applicable to: ALL

Electrical heating protects:
- Pitot probes
- Static ports
- Angle-Of-Attack (AOAs) probes
- Total Air Temperature (TAT) probes.

Three independent Probe Heat Computers (PHCs) automatically control and monitor:
- Captain probes
- F/O probes
- STBY probes.

They protect against overheating and indicate faults.

The probes are heated:
- Automatically when at least one engine is running, or when the aircraft is in flight.
- Manually, when the flight crew switches ON the PROBE/WINDOW HEAT pb.

On the ground, the TAT probes are not heated and pitot heating operates at a low level (the changeover to normal power in flight is automatic).

Intentionally left blank

OVERHEAD PANEL

RAIN RPLNT

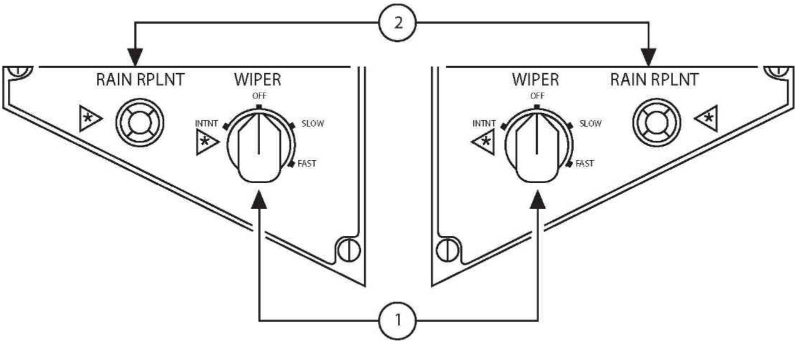
OVERHEAD PANEL

Ident.: DSC-30-60-20-00017466.0001001 / 21 MAR 16
Applicable to: ALL

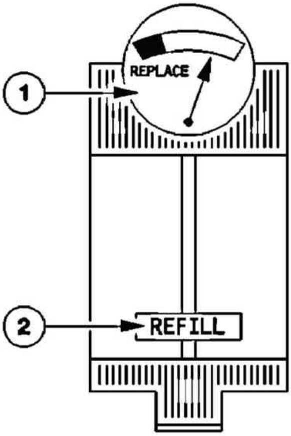


(1) WIPER rotary selector
Each rotary selector controls its wiper at low speed, high speed, or intermittent sweeping ◁ .
When turned off, the wiper stops out of view.

(2) RAIN RPLNT pb-sw ◁
Each of these buttons controls the application of rain repellent fluid to the corresponding side of the front windshield.
When the flight crew pushes the button, the timer applies a measured quantity of rain repellent to the windshield. To repeat the cycle, the flight crew must push the button again.
This function is inhibited when the aircraft is on the ground and the engines are stopped.

RAIN REPELLENT ⋖ SYSTEM INDICATORS

Ident.: DSC-30-60-20-00017587.0001001 / 21 MAR 16
Applicable to: ALL



(1) Rain Repellent pressure indicator
This gauge shows the nitrogen pressure and therefore the remaining fluid in the rain repellent bottle. When the needle is in the yellow sector the bottle should be replaced.

(2) Rain Repellent low level indicator (depending on aircraft configuration)
When the REFILL float is in view the bottle should be replaced.

VISUAL ICE INDICATOR

Ident.: DSC-30-70-10-00017471.0001001 / 21 MAR 16
Applicable to: ALL

An external visual ice indicator is installed between the two windshields.
There can be also an external ice detector light ◁✻

ICE DETECTION SYSTEM

Ident.: DSC-30-70-10-00017472.0001001 / 21 MAR 16
Applicable to: MSN 04563, 04827-04860, 05005, 05097, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11597

The ice detection system has two separate ice detector probes on the forward lower section of the fuselage.
The probes detect ice accretion. They also indicate, through the MEMO display, that icing conditions have disappeared. The system logic generates ECAM messages according to ice detector signals and the flight crew's selection of engine or wing anti-icing systems.
The ice detection system does not control the ENG or WING anti-icing systems.

Intentionally left blank

INTRODUCTION

Ident.: DSC-31-05-10-00001182.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

The Electronic Instrument System (EIS) presents data on six identical Display Units (DUs):

- The Electronic Flight Instrument System (EFIS) displays mostly flight parameters and navigation data on the Primary Flight Displays (PFDs) and Navigation Displays (NDs).
- The Electronic Centralized Aircraft Monitor (ECAM) presents data on the Engine/Warning Display (E/WD) and System Display (SD) :
  - Primary engine indications, fuel quantity, flap and slat position
  - Warning and caution alerts, or memos
  - Synoptic diagrams of aircraft systems, and status messages
  - Permanent flight data

DISPLAY UNIT (DU)

Ident.: DSC-31-05-30-00001184.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

The instrument panels have six identical units.
These DUs are full-color cathode ray tubes.

DISPLAY UNIT (DU)

Ident.: DSC-31-05-30-00001184.0002001 / 21 MAR 16
1 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The instrument panels have six identical units.
These DUs are full-color Liquid Crystal Displays (LCD).

DISPLAY MANAGEMENT COMPUTER (DMC)

Ident.: DSC-31-05-30-00001185.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

Three identical Display Management Computers acquire and process all the signals received from sensors and other computers to generate the images to be displayed on the primary flight displays, navigation displays, engine/warning display, and system display.
Each DMC has two independent channels : An EFIS channel and an ECAM channel. Each DMC is able to simultaneously drive one PFD, one ND, and either one of the ECAMs in its engine warning or system status mode.

DISPLAY MANAGEMENT COMPUTER (DMC)

Ident.: DSC-31-05-30-00001185.0002001 / 20 DEC 10
2 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

Three identical Display Management Computers (DMCs) obtain data from the different sensors and computers, and send it to the display units. The display units then generate and display the applicable images. Each DMC has a single DMC channel, and can simultaneously supply one PFD, one ND and both ECAM display units (E/WD and SD).

SYSTEM DATA ACQUISITION CONCENTRATOR (SDAC)

Ident.: DSC-31-05-30-00001186.0001001 / 21 MAR 16
Applicable to: ALL

The two identical SDACs acquire data, then generate signals. Some of these signals go to the three DMCs, which use them to generate displays of system pages and engines parameters. Others go to the flight warning computers, which use them to generate ECAM messages and aural alerts.

FLIGHT WARNING COMPUTER (FWC)

Ident.: DSC-31-05-30-00001187.0001001 / 13 JAN 14
Applicable to: ALL

The two identical FWCs generate alert messages, memos, aural alerts, and synthetic voice messages. For this purpose they acquire data:
- Directly from aircraft sensors, or systems, to generate red warnings
- Through the SDACs to generate amber cautions.

The ECAM display units display the alert messages generated by the FWCs.

The FWCs also generate:
- Radio height callouts
- Decision height callouts
- Landing distance and landing speed increments.

ATTENTION - GETTERS

Ident.: DSC-31-05-30-00001188.0001001 / 21 MAR 16
Applicable to: ALL

The FWCs also drive the attention-getters. Each pilot has a set of these on the panel under the glareshield. They are :
- A master warning light, that flashes “MASTER WARN” in red, for red warnings.
- A master caution light, that illuminates “MASTER CAUT” in amber, for amber cautions.

LOUDSPEAKER

Ident.: DSC-31-05-30-00001189.0001001 / 21 MAR 16
Applicable to: ALL

The communications loudspeakers announce aural alerts and voice messages, and do so even when they are turned off.

ECAM CONTROL PANEL (ECP)

Ident.: DSC-31-05-40-00001191.0001001 / 21 MAR 16
Applicable to: ALL

The ECAM Control Panel, located on the pedestal, includes :

- Such E/WD controls, as CLR, STS, and the brightness control knob.
- Such SD controls, as ENG, BLEED, PRESS..., system page selector, and the brightness control knob.

EIS DMC SWITCHING SELECTOR

Ident.: DSC-31-05-40-00001192.0001001 / 22 MAR 16
Applicable to: ALL

A switch near the center of the SWITCHING panel which is located just above the ECAM control panel, enables the flight crew to replace the Captain or First Officer's Display Management Computer (DMC 1, or DMC 2) by DMC 3.

ECAM/ND SWITCHING

Ident.: DSC-31-05-40-00001193.0001001 / 21 MAR 16
Applicable to: ALL

A switch on the right-hand side of the SWITCHING panel enables the flight crew to transfer the ECAM System Display to either the Captain or First Officer's Navigation Display.

EFIS SWITCHING

Ident.: DSC-31-05-40-00001194.0001001 / 21 MAR 16
Applicable to: ALL

A PFD/ND XFR pushbutton on each side console enables the pilot to swap displays to the respective onside DUs.

Intentionally left blank

RECONFIGURING THE DISPLAY MANAGEMENT COMPUTER (DMC)

Ident.: DSC-31-05-50-00001195.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

In normal operation, each DMC drives the following Display Units :

- DMC 1 drives the CAPT PFD, CAPT ND and the upper ECAM DUs.
- DMC 2 drives the F/O PFD and F/O ND, and the lower ECAM DU.
- DMC 3 is on standby.

If a DMC fails (corresponding DU shows a diagonal line), the flight crew can replace DMC 1 or 2 with DMC 3 by turning the EIS DMC switch on the SWITCHING panel to “CAPT 3” or “F/O 3”.

RECONFIGURING THE DISPLAY MANAGEMENT COMPUTER (DMC)

Ident.: DSC-31-05-50-00001195.0002001 / 21 MAR 16
1 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

In normal operation, each DMC drives the following Display Units :

- DMC 1 drives the CAPT PFD, CAPT ND and the ECAM DUs.
- DMC 2 drives the F/O PFD and F/O ND.
- DMC 3 is on standby, ready to drive any DU.

If DMC 1 or 2 fails (the “INVALID DATA” message is displayed on the DUs), the crew manually selects the DMC 3 source (“CAPT 3” or “F/O 3”).
If DMC 1 fails (or DMC 3, if “CAPT 3” was selected), DMC 2 automatically drives the ECAM.

Intentionally left blank

FAILURE OF UPPER ECAM DU (OR CTL/BRIGHTNESS KNOB TURNED TO OFF)

Ident.: DSC-31-05-60-00001196.0001001 / 21 MAR 16
Applicable to: ALL

If the upper ECAM display fails, or is switched off :
- The engine/warning page automatically replaces the system/status page on the lower ECAM DU.

The flight crew can display the system/status page by :
- Using the “ECAM/ND XFR“ switch, on the SWITCHING panel, to move it to a Navigation Display Unit (NDU), or
- Pushing and holding (for a maximum of 3 min) the related system page pushbutton, on the ECAM control panel, to temporarily display it on the lower ECAM DU (instead of the engine/warning page).

FAILURE OF LOWER ECAM DU (OR CTL/BRIGHTNESS KNOB TURNED TO OFF)

Ident.: DSC-31-05-60-00001197.0001001 / 21 MAR 16
Applicable to: ALL

If the lower ECAM display fails, or is switched off, the flight crew can display the system/status page by :
- Using the "ECAM/ND XFR" switch, on the SWITCHING panel, to display it on the NDU, or
- Pushing and holding (for a maximum of 3 min) the related system page pushbutton, on the ECAM control panel, to temporarily display it on the upper ECAM DU (instead of the engine/warning page).

FAILURE OF BOTH ECAM DUs

Ident.: DSC-31-05-60-00001198.0001001 / 21 MAR 16
Applicable to: ALL

If both ECAM displays fail, the flight crew may :
- Use the "ECAM/ND XFR", on the SWITCHING panel, to display the engine/warning page on a navigation display and, if needed,
- Push and hold (for a maximum of 3 min) the related system page pushbutton, on the ECAM control panel, to temporarily display the system/status page on an ND.

PFDU/NDU RECONFIGURATION

Ident.: DSC-31-05-60-00001199.0001001 / 21 MAR 16
Applicable to: ALL

If a PFDU fails, the system automatically transfers the PFD image to the NDU.

The pilot can also make this transfer manually by :
- turning the PFD ON-OFF/brightness control OFF, or
- pressing the PFD/ND/XFR pushbutton, which cross-changes the images between the PFDU and the NDU.

If an NDU fails, the pilot can use the PFD/ND/XFR pushbutton to transfer the ND image to the PFDU.

GENERAL

Ident.: DSC-31-05-60-00012844.0001001 / 20 DEC 10
1 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

These messages are displayed on either the EFIS or the ECAM Display Unit (DU) depending on the current EFIS or ECAM configuration.

FAILURE OF A DU

Ident.: DSC-31-05-60-00012846.0001001 / 20 DEC 10
2 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

If a DU fails, the flight crew may find one of the following displays:
- A blank screen with an “F” letter in amber, or
- A distorted display, or
- A blank screen with the “INVALID DISPLAY UNIT” message in amber.

FEEDBACK MESSAGES

Ident.: DSC-31-05-60-00012847.0001001 / 20 DEC 10
3 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The DU displays the following messages in amber when the Display Management Computer (DMC) detects a discrepancy between the parameters obtained by the DMC and the operational parameters displayed on the DU:
- ”CHECK CAPT PFD” (“CHECK F/O PFD”) if the discrepancy concerns the PFD parameters
- ”CHECK CAPT ND” (“CHECK F/O ND”) if the discrepancy concerns the ND parameters
- ”CHECK EWD” if the discrepancy concerns the E/WD parameters
- ”CHECK SD” if the discrepancy concerns the SD parameters.

In addition, if the aircraft is on ground, the “DU NOT MONITORED” message is displayed in amber when there is only one DMC, instead of two DMCs, that provides the affected DU with feedback information.
This message means that there is either a DMC test in progress or that there is an EIS failure.
In the case of an EIS failure, a maintenance action is necessary.

SIDE1/SIDE2 DISCREPANCY MESSAGES

Ident.: DSC-31-05-60-00012848.0003001 / 04 NOV 21
Applicable to: ALL

The DU displays the following messages along with a caution on the ECAM E/WD.

CHECK ATT	Attitude data displayed on both PFDs differ by more than 5 ° in pitch and/or roll.

CHECK ALT	Altitude data displayed on both PFDs differ by: - More than 250 ft when the flight crew selects a QNH different from STD, or - More than 500 ft when the flight crew selects a QNH STD. *Note:* *The caution and the CHECK ALT message disappear, when the CAPT EFIS and the F/O EFIS barometer references disagree.*
CHECK HDG	Heading data displayed on both PFDs and NDs differ by more than 5 °. *Note:* - *The CHECK HDG message flashes for a few seconds on the NDs, and then remains steady.* - *If the flight crew selects the PLAN mode on the NDs, the message is not displayed.*

DU RESET

Ident.: DSC-31-05-60-00012849.0001001 / 20 DEC 10

4 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

In the case of a DU reset, the message “SELF TEST IN PROGRESS” can be displayed in green and/or the message “WAITING FOR DATA” may be displayed in green during the EIS initialization.

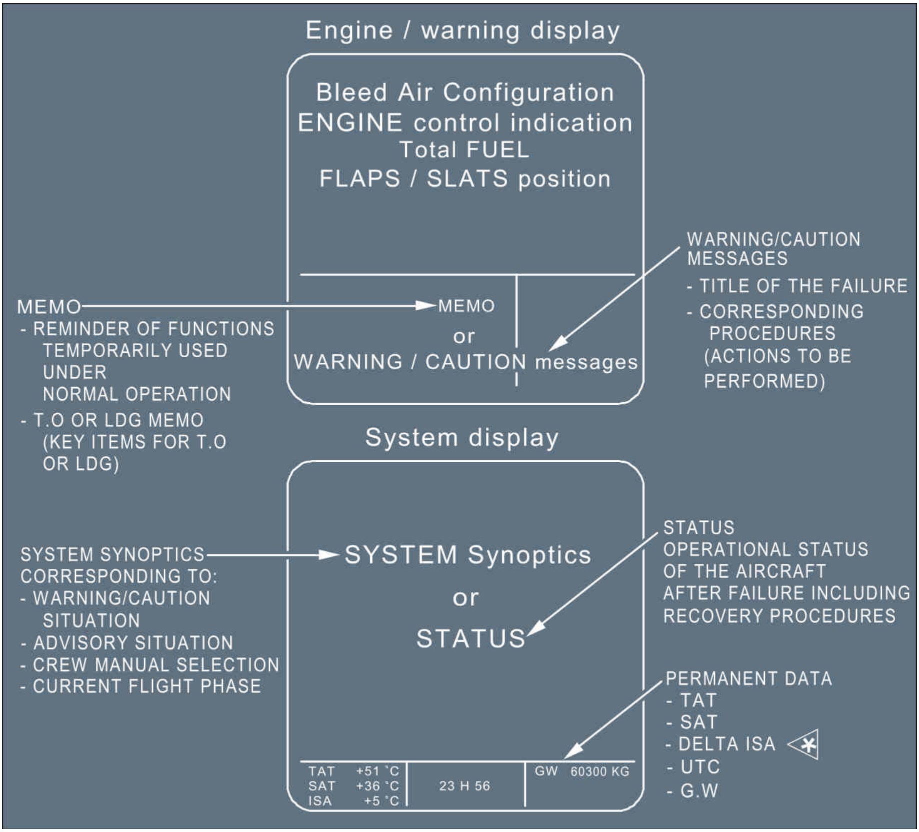
Intentionally left blank

ECAM DU ARRANGEMENT

Ident.: DSC-31-10-00017519.0002001 / 21 MAR 16

1 **Applicable to: MSN 08495-09324, 10949-11597**

The ECAM has two display units:
- One for the engine/warning display (E/WD).
- One for the system/status display (SD).



Engine / warning display
Bleed Air Configuration
ENGINE control indication
Total FUEL
FLAPS / SLATS position
MEMO
or
WARNING / CAUTION messages
MEMO
- REMINDER OF FUNCTIONS TEMPORARILY USED UNDER NORMAL OPERATION
- T.O OR LDG MEMO (KEY ITEMS FOR T.O OR LDG)
WARNING/CAUTION MESSAGES
- TITLE OF THE FAILURE
- CORRESPONDING PROCEDURES (ACTIONS TO BE PERFORMED)
System display
SYSTEM Synoptics
or
STATUS
SYSTEM SYNOPTICS CORRESPONDING TO:
- WARNING/CAUTION SITUATION

COLOR CODE

Ident.: DSC-31-10-00001202.0001001 / 21 MAR 16
Applicable to: ALL

The ECAM display uses a color code that indicates the importance of the failure or the indication.

RED	:	The configuration or failure requires immediate action.
AMBER	:	The flight crew should be aware of the configuration or failure, but need not take immediate action.
GREEN	:	The item is operating normally.
WHITE	:	These titles and remarks guide the flight crew, as they execute various procedures.
BLUE	:	These are actions to be carried out, or limitations.
MAGENTA	:	These are particular messages that apply to particular pieces of equipment or situations (inhibition messages, for example).

WARNING/CAUTION CLASSIFICATION

Ident.: DSC-31-10-00001203.0001001 / 21 MAR 16
Applicable to: ALL

	LEVEL	SIGNIFICATION	AURAL	VISUAL
FAILURE MODE	Level 3	Red warning : The configuration, or failure requires immediate action : - Aircraft in dangerous configuration, or limit flight conditions (eg: stall, o/speed) - System failure altering flight safety (eg : Eng fire, excess cab alt)	Continuous Repetitive Chime (CRC) or specific sound or synthetic voice	- MASTER WARN light red flashing or specific red light - Warning message (red) on E/WD - Automatic call of the relevant system page on the S/D [(1)].
	Level 2	Amber caution : The flight crew should be aware of the configuration or failure, but does not need to take any immediate action. However, time and situation permitting, these cautions should be considered without delay to prevent any further degradation of the affected system : - System failure without any direct consequence on the flight safety (eg: HYD G SYS LO PR)	Single Chime (SC)	- MASTER CAUT light amber steady - Caution message (amber) on E/WD - Automatic call of the relevant system page on the S/D [(1)].
	Level 1	Amber caution : Requires crew monitoring : - Failures leading to a loss of redundancy or system degradation (eg : FCDC fault)	NONE	- Caution message (amber) on E/WD generally without procedure.
INFORMATION	ADVISORY	System parameters monitoring	NONE	- Automatic call of the relevant system page on the S/D. The affected parameter pulses green.
	MEMO	Information : Recalls normal or automatic selection of functions which are temporarily used	NONE	- Green, Amber, or Magenta message on E/WD

(1) *except in some cases*

PRIORITY RULES

Ident.: DSC-31-10-00001204.0001001 / 17 MAR 17
Applicable to: ALL

There are three priority levels for warnings and cautions :
- A level 3 warning has priority over a level 2 caution which has priority over a level 1 caution.
The FWC observes these priorities.

INFORMATION PROVIDED WHEN NEEDED

One of the main advantages of the ECAM is that it displays applicable information to the flight crew, on an "as needed" basis. The following outlines the ECAM's operating modes:

- **Normal Mode**:
  Automatically displays systems and memos, in accordance with the flight phase.
- **Failure Mode**:
  Automatically displays the appropriate emergency/abnormal procedures, in addition to their associated system synoptic.
- **Advisory Mode**:
  Automatically displays the appropriate system synoptic, associated with a drifting parameter.
- **Manual Mode**:
  Enables the flight crew to manually select any system synoptic via the ECAM Control Panel (ECP).

Most warnings and cautions are inhibited during critical phases of flight (T/O INHIBIT – LDG INHIBIT), because most system failures will not affect the aircraft's ability to continue a takeoff or landing.

TYPES OF FAILURES

Ident.: DSC-31-10-00001205.0001001 / 21 MAR 16
Applicable to: ALL

Independent	:	a failure that affects an isolated system or item of equipment without degrading the performance of others in the aircraft.
Primary	:	a failure of a system or an item of equipment that costs the aircraft the use of other systems or items of equipment.
Secondary	:	the loss of a system or an item of equipment resulting from a primary failure.

ECAM MESSAGES

The lower part, dedicated to ECAM messages, is divided into two sections of several lines each.

Bottom left : - Primary or independent warnings and cautions, or
- Memo information.

Bottom right : - Title of the system affected by a primary or independent warning or caution, in case of overflow on the bottom left part, or
- Secondary failure, or
- Memo, or
- Special lines (such as “AP OFF”, “LAND ASAP”).

As soon as the FWC detects a failure, and if there is no flight phase inhibition active, the E/WD displays the title of the failure and actions to be taken.
The action line automatically clears, when the flight crew has performed the required action.

Note: *Certain actions lines will not disappear after being done.*

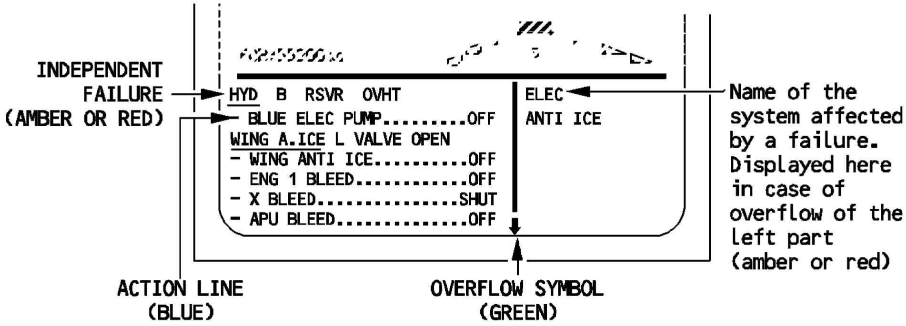
INDEPENDENT FAILURE

Ident.: DSC-31-15-00001208.0001001 / 03 FEB 11
Applicable to: ALL

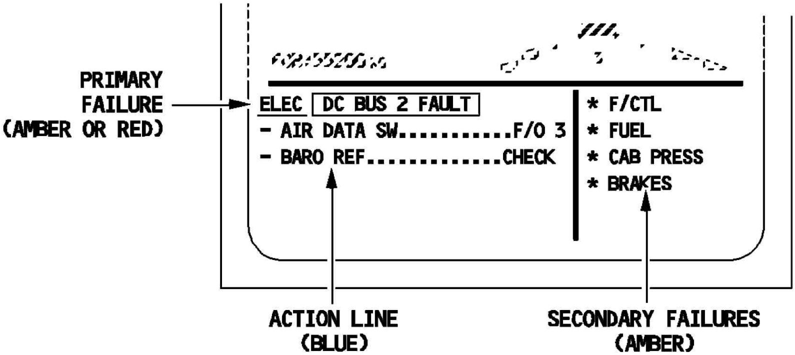


INDEPENDENT FAILURE (AMBER OR RED)
HYD B RSVR OVHT
BLUE ELEC PUMP.........OFF
WING A.ICE L VALVE OPEN
- WING ANTI ICE..........OFF
- ENG 1 BLEED............OFF
- X BLEED................SHUT
- APU BLEED..............OFF
ELEC
ANTI ICE
Name of the system affected by a failure. Displayed here in case of overflow of the left part (amber or red)
ACTION LINE (BLUE)
OVERFLOW SYMBOL (GREEN)

If there are too many ECAM messages for the amount of space available in the lower part of the E/WD, a green arrow appears at the bottom of the display, pointing down to show that the information has overflowed off the screen. The pilot can scroll down to view additional messages by pushing the CLR pushbutton on the ECAM control panel (on the pedestal, just below the lower ECAM DU).

PRIMARY AND SECONDARY FAILURE

Ident.: DSC-31-15-00001209.0001001 / 03 FEB 11
Applicable to: ALL



PRIMARY FAILURE (AMBER OR RED)
ELEC DC BUS 2 FAULT
- AIR DATA SW..........F/O 3
- BARO REF............CHECK
* F/CTL
* FUEL
* CAB PRESS
* BRAKES
ACTION LINE (BLUE)
SECONDARY FAILURES (AMBER)

The ECAM DU displays a primary failure as a boxed title.
It identifies a secondary failure by putting a star in front of the title of the affected system.

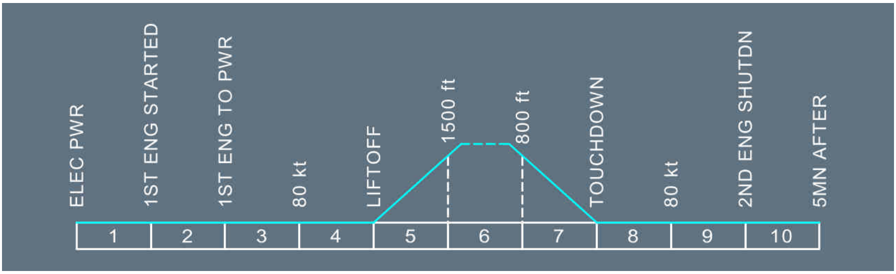
Note: *The DU displays the overflow symbol, if primary or secondary failures overflow. In case of ELEC EMER CONFIG, the secondary failures are inhibited.*

FLIGHT PHASES

Ident.: DSC-31-15-00001210.0001001 / 21 MAR 16
Applicable to: ALL

GENERAL

The FWC divides its functions according to these ten flight phases :



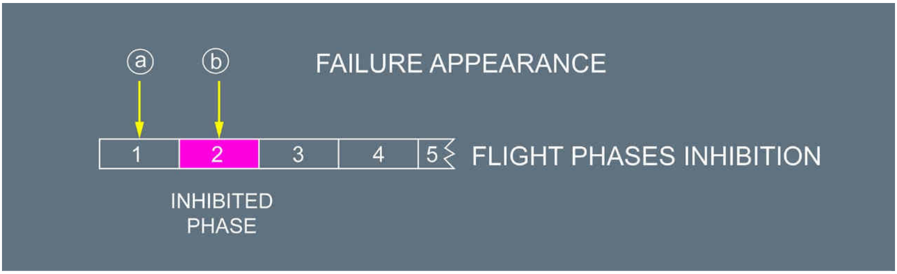
ELEC PWR
1ST ENG STARTED
1ST ENG TO PWR
80 kt
LIFTOFF
1500 ft
800 ft
TOUCHDOWN
80 kt
2ND ENG SHUTDN
5MN AFTER
1
2
3
4
5
6
7
8
9
10

To improve its operational efficacy, the computer inhibits some warnings and cautions for certain flight phases. It does so to avoid alerting the pilots unnecessarily at times when they have high workloads, such as during takeoff or landing. In these two phases, the DU displays magenta memos : “T.O. INHIBIT” (flight phases 3, 4, and 5), and “LDG INHIBIT” (flight phases 7 and 8).

Note: These flight phases are different from and independent of the ones that the FMGC uses.

FLIGHT PHASE INHIBITION

Two cases are possible (for instance) :



Effect on E/WD :

(a) The failure occurs during phase 1. The E/WD displays the warning immediately and continues to display it as long as the failure is present, even in phase 2.

(b) The failure occurs during phase 2. The E/WD displays the warning only when the aircraft has entered phase 3, where it is not inhibited. Then the warning remains displayed as long as the failure is present.

MEMOS

Ident.: DSC-31-15-A-00001211.0001001 / 21 MAR 16
Applicable to: ALL

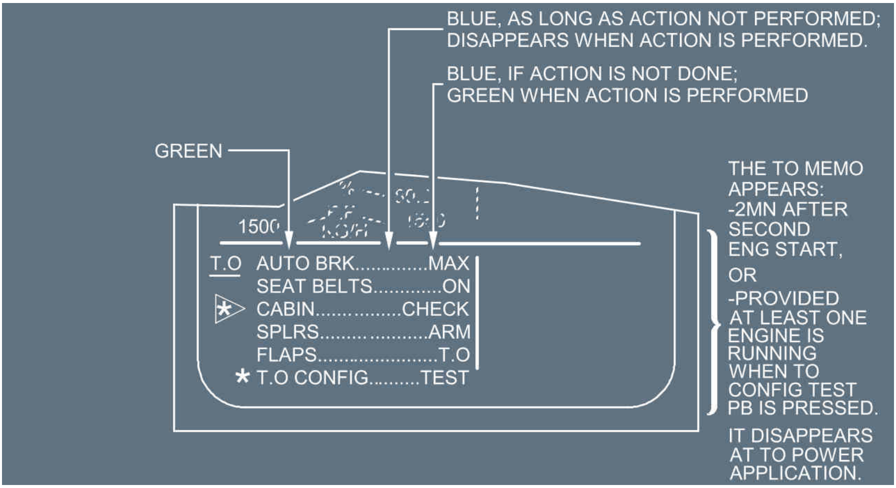
DISPLAY

Memos appear in the lower part of the E/WD. They are normally in green, but may be amber in abnormal situations.
Memos list functions or systems that are temporarily used in normal operations.

Ident.: DSC-31-15-A-00001212.0010001 / 09 FEB 18
2 **Applicable to: MSN 08635, 10949-11597**

TO AND LDG MEMOS

During the takeoff and landing phases, the right side of the memo area displays specific TO INHIBIT or LDG INHIBIT (magenta) memos.
Takeoff and landing memos are displayed, as follows, during the related flight phases:



BLUE, AS LONG AS ACTION NOT PERFORMED;
DISAPPEARS WHEN ACTION IS PERFORMED.
BLUE, IF ACTION IS NOT DONE;
GREEN WHEN ACTION IS PERFORMED
GREEN
1500
T.O AUTO BRK..............MAX
SEAT BELTS............ON
CABIN................CHECK

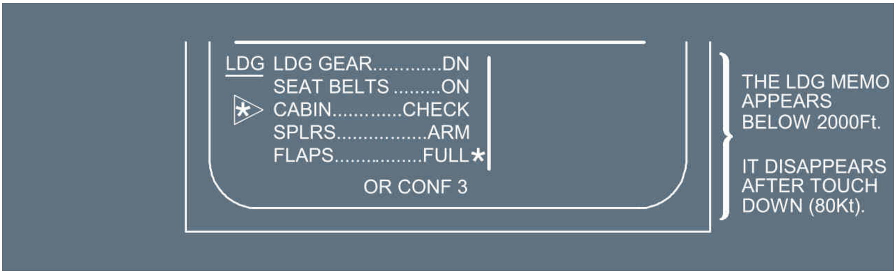
FLAPS......................T.O
* T.O CONFIG.........TEST
THE TO MEMO APPEARS:
-2MN AFTER SECOND ENG START,
OR
-PROVIDED AT LEAST ONE ENGINE IS RUNNING WHEN TO CONFIG TEST PB IS PRESSED.
IT DISAPPEARS AT TO POWER APPLICATION.

(*) This line disappears when the test is completed. It is replaced by “TO CONFIG NORMAL”, if aircraft configuration is correct.
The test is requested again, if the configuration becomes abnormal.



LDG LDG GEAR.............DN
SEAT BELTS ....ON
CABIN.............CHECK
SPLRS.................ARM
FLAPS.................FULL*
OR CONF 3
THE LDG MEMO APPEARS BELOW 2000Ft.
IT DISAPPEARS AFTER TOUCH DOWN (80Kt).

(*) “CONF 3” is displayed in alternate or direct law, or if the GPWS LDG FLAP 3 pushbutton is ON.

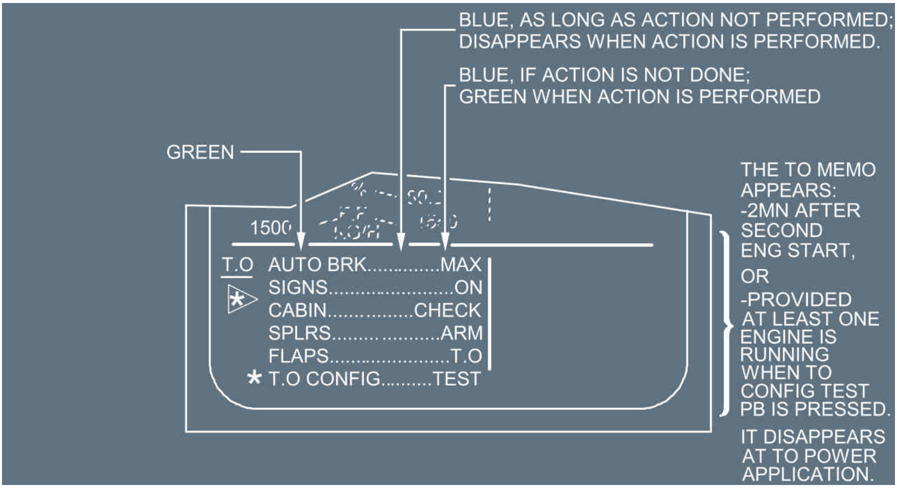
Note: *After a go-around, if the aircraft does not climb above 2 200 ft RA, the landing memo appears only below 800 ft RA during the subsequent approach.*

Ident.: DSC-31-15-A-00001212.0002001 / 22 APR 16

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-08596, 09190-09324

TO AND LDG MEMOS

During the takeoff and landing phases, the right side of the memo area displays specific TO INHIBIT or LDG INHIBIT (magenta) memos.
Takeoff and landing memos are displayed, as follows, during the related flight phases:



BLUE, AS LONG AS ACTION NOT PERFORMED; DISAPPEARS WHEN ACTION IS PERFORMED.
BLUE, IF ACTION IS NOT DONE; GREEN WHEN ACTION IS PERFORMED
GREEN
1500
T.O
AUTO BRK..............MAX
SIGNS........................ON

GENERAL

Ident.: DSC-31-20-00001215.0001001 / 21 MAR 16
Applicable to: ALL

The system/status display (SD) uses the lower ECAM DU to display :
- pages showing synoptic diagrams of the aircraft systems, or
- the status page.

SYSTEM PAGES

Ident.: DSC-31-20-00001216.0001001 / 10 MAY 21
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

The lower ECAM DU can display 12 system pages (for description see relevant FCOM chapter):
- ENGINE (secondary engine parameters)
- BLEED (air bleed)
- CAB PRESS (cabin pressurization)
- ELEC (electric power)
- HYD (hydraulic)
- FUEL (fuel)
- APU (auxiliary power unit)
- COND (air conditioning)
- DOOR/OXY (doors/oxygen)
- WHEEL (landing gear, braking, ground spoilers, etc.)
- F/CTL (flight controls)
- CRUISE (cruise).

The flight crew may manually call up a system page for display on the lower ECAM DU, or the system may automatically display a page.
- Manually:
  - The flight crew can, at any time, use the pushbutton on the ECAM's control panel to call up and display any system page, except the CRUISE page
  - The corresponding pushbutton on the ECAM control panel lights up
  - A failure-related or advisory display automatically replaces a page the flight crew has manually called up.
- Automatically, related to a failure:
  - The relevant system page automatically appears, as soon as any fault or malfunction triggers a caution or warning message.

- Automatically, related to an advisory:
  - The relevant system page automatically appears, when a parameter drifts out of its normal range
  - The value (shown in green) pulses, as long as it is outside its limits
  - The advisory mode is inhibited in some flight phases.

(1) Limitations (speed, flight level): Blue

(2) Approach procedures: White (Red) (Amber)

(3) Procedures (corrections to apply for landing): Blue

(4) Information: Green

(5) Cancelled caution: White

(6) Inoperative system: Amber

(7) Maintenance status: White

(8) The arrow appears if the data on the STATUS page overflows the left or right area of the page.

The flight crew can press the CLR pb, in order to scroll the display to view the overflow.

Note: *The titles of the different parts of the display appear in white and underlined.*

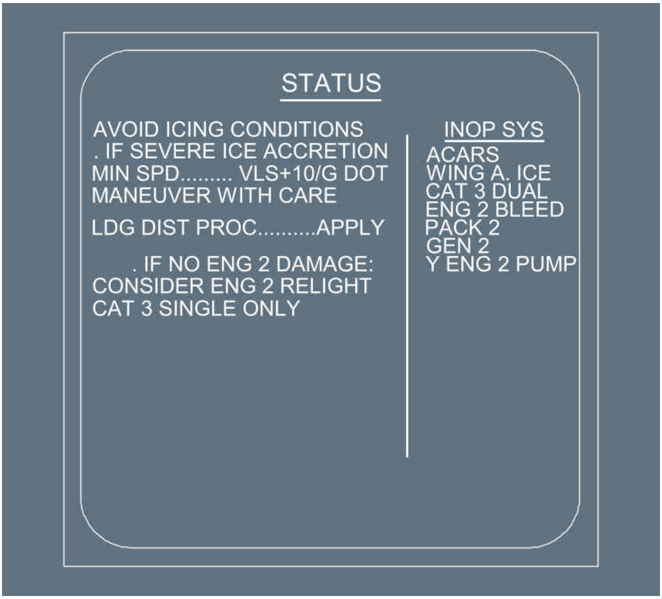
STATUS PAGE DISPLAY

The STATUS page appears when the flight crew presses the STS pb on the ECAM Control Panel (ECP).

The STATUS page automatically appears in abnormal operations if one of the following applies:
- The STATUS page is not empty, and the flight crew clears the last alert on the E/WD, or
- The STATUS page is not empty, and the flight crew selects the CONF1 for approach.

BLANK LINES

Each block that is described above (limitation block (1), approach procedure block (2), etc.) is separated by a blank line.
Therefore, a condition that is included in a limitation block (1) and the associated action line that is included in the procedure block (3) are separated by a blank line.
Example: Illustration with the ECAM alert ENG 1(2) SHUTDOWN.



STATUS

AVOID ICING CONDITIONS
. IF SEVERE ICE ACCRETION
MIN SPD......... VLS+10/G DOT
MANEUVER WITH CARE

Y ENG 2 PUMP

In this example, the action line “LDG DIST PROC … APPLY” applies only in the case of severe ice accretion.

STS REMINDER

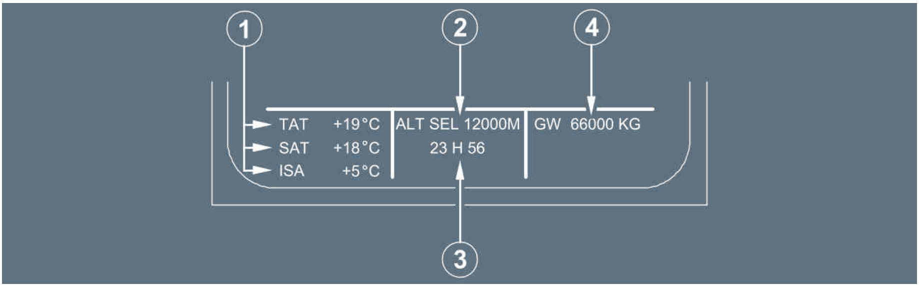
The STS reminder appears on the E/WD if both the following conditions apply:
- The STATUS page is not empty: The STATUS page displays message other than “CANCELLED CAUTION” or MAINTENANCE status.
- There is a MAINTENANCE status at engines shutdown.

The MAINTENANCE status can appear only when the aircraft is on the ground, before engine start or after engine shutdown.

PERMANENT DATA

Ident.: DSC-31-20-00017520.0002001 / 25 JUL 16

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321



(1) Temperature

The screen displays the Total Air Temperature (TAT) and Static Air Temperature (SAT) in green.

The difference between the SAT and the International Standard Atmosphere (ISA) temperature (Delta ISA ◁) is displayed in green, in standard altitude mode and when the SAT is valid.

(2) G LOAD - ALT SEL

The screen displays one of the following items:

- The Load factor (G LOAD) in amber, when the value is above 1.4 g or below 0.7 g for more than 2 s. The G LOAD amber indication remains displayed 5 s after the excessive load occurrence. The display of the load factor is inhibited during flight phases 1, 2 and 3.
- Altitude in green selected via the Flight Control Unit (FCU), if the flight crew selects metric units, and provided the load factor is not displayed.

(3) UTC

The screen displays the Universal Time Coordinated (UTC), synchronized with the cockpit clock, in green.

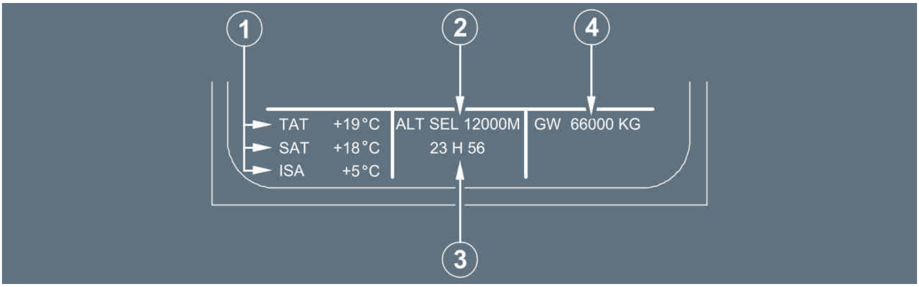
(4) GW

The screen displays the gross weight (GW) in green, as soon as the first engine is started. The last two digits are dashed, if accuracy is degraded. On ground, the indication is replaced by blue dashes, if no computed data is available.

PERMANENT DATA

Ident.: DSC-31-20-00017520.0011001 / 17 MAY 21

2 **Applicable to: MSN 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**



(1) Temperature
The screen displays the Total Air Temperature (TAT) and Static Air Temperature (SAT) in green.
The difference between the SAT and the International Standard Atmosphere temperature (ISA) temperature (Delta ISA ◁) is displayed in green, in standard altitude mode and when the SAT is valid.

(2) G LOAD - ALT SEL

The screen displays one of the following items:
- Load factor (G LOAD) in amber, when the value is above 1.4 g or below 0.7 g for more than 2 s. The G LOAD amber indication remains displayed 5 s after the excessive load occurrence. The display of the load factor is inhibited during flight phases 1, 2, 3, 9 and 10.
- Altitude in green selected via the Flight Control Unit (FCU), if the flight crew selects metric units, and provided the load factor is not displayed.
- “CHECK CAPT (F/O) PFD”, “CHECK CAPT (F/O) ND” or “CHECK SD” all in amber (*Refer to DSC-31-05-20 Cockpit Arrangement*).

Note: The display of the feedback messages takes priority over the load factor indication.

(3) UTC
The screen displays the Universal Time Coordinated (UTC), synchronized with the cockpit clock, in green.

(4) GW
The screen displays the Gross Weight (GW) in green, as soon as the flight crew starts the first engine. The last two digits are dashed, if accuracy is degraded. On ground, blue dashes are displayed instead of the indication, if no computed data is available.

Ident.: DSC-31-20-00015526.0001001 / 01 APR 14
Applicable to: ALL

If the accuracy of a parameter value on any SD page is degraded, amber dashes are displayed over the last digits.

GENERAL

Ident.: DSC-31-25-10-00001219.0001001 / 22 MAR 16
Applicable to: ALL

If ECAM detects a failure :
- The E/WD displays warning or caution messages.
- The master warning or master caution lights light up (except in the case of a level 1 caution).
- The system sounds an aural signal (except in the case of a level 1 caution).
- The system display (SD) shows the system page for the affected system.
- The CLR pushbutton on the ECAM control panel lights up.

In addition, a local warning light controlled directly by the affected system can light up.

After completing remedial procedures, the flight crew must push the CLR pushbutton repeatedly until the displays return to their normal configurations :
- MEMO messages on the E/WD
- The system page related to the present flight phase on the SD.
- The CLR light on the ECAM control panel turned off.

Intentionally left blank

1 - THE ECAM DETECTS NO FAILURE

For example, a hydraulic reservoir is overheat.

COCKPIT INDICATIONS

- A single chime sounds
- Both MASTER CAUTION lights come on, and stay on
- A FAULT light, on the overhead HYD panel, comes on
- The memo space on the E/WD displays the “HYD B RSVR OVHT” message, and the “BLUE ELEC PUMP . . . . . OFF” instruction
- The lower ECAM display (SD) automatically calls up the hydraulic system's diagram, and displays “OVHT” in amber next to the blue system
- The ECAM's CLR pushbutton lights up.

3 - THE FLIGHT CREW FOLLOWS THE INSTRUCTION DISPLAYED ON THE E/WD

Ident.: DSC-31-25-20-00001222.0001001 / 09 OCT 12
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

The flight crew switches off the BLUE ELEC PUMP pushbutton, depressurizing the blue hydraulic circuit.

COCKPIT INDICATIONS

- A single chime sounds.
- Both MASTER CAUTION lights stay on.
- A FAULT/OFF light, on the overhead panel, comes on.
- The second part of the message on the E/WD changes to “B SYS LO PR”.
- The SD's system diagram shows an amber zero for the pressure in the blue system, along with the amber “OVHT”.
- The right side of the memo area indicates a secondary failure in the flight control system.
- The ECAM control panel's CLR pushbutton remains on.

4 The flight crew switches off the BLUE ELEC PUMP pb-sw, depressurizing the blue hydraulic circuit.

5 COCKPIT INDICATIONS

- A single chime sounds
- Both MASTER CAUTION lights stay on
- A FAULT/OFF light, on the overhead panel, comes on
- The second part of the message on the E/WD changes to B SYS LO PR
- The SD's system diagram shows 0 for the pressure in the blue system, along with OVHT
- The right side of the memo area indicates a secondary failure in the flight control system
- The ECAM control panel's CLR pb remains on.

5 - ONE OF THE PILOTS PUSHES THE CLR PUSHBUTTON A SECOND TIME

Ident.: DSC-31-25-20-00001224.0004001 / 09 OCT 12

Applicable to: MSN 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

COCKPIT INDICATIONS

- The ECP's CLR and STS pushbuttons light up.
- The FAULT/OFF lights stay on.
- The E/WD's memo area returns to normal.
- The STATUS page automatically appears on the SD, displaying the procedures for completing the flight with a faulty blue system.

GENERAL

Ident.: DSC-31-27-00001226.0001001 / 09 NOV 20
Applicable to: ALL

The OEB reminder function provides operational help to the flight crew. This function enables the flight crew to clearly identify on the ECAM any procedure and STATUS message superseded by an OEB procedure.
When a situation causes an ECAM alert to trigger, a message informs the flight crew in real time if there is an OEB for the displayed ECAM alert and/or STATUS messages. As a result, the ECAM procedure and/or STATUS message is changed. In this case, a specific ECAM message informs the flight crew to refer to the QRH.

DESCRIPTION

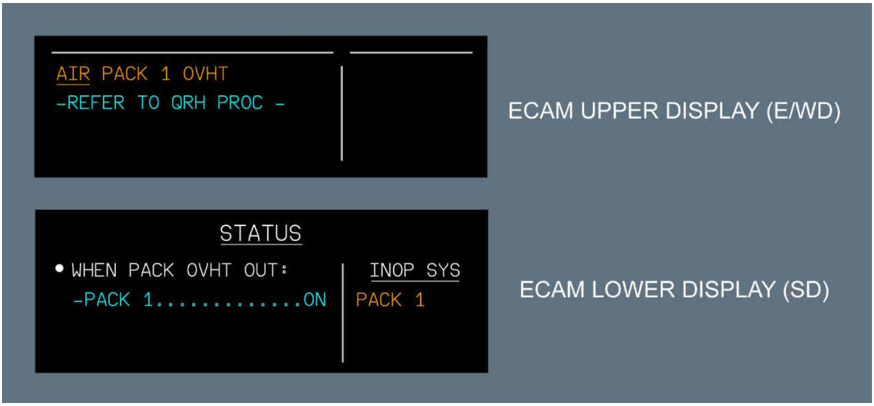
Ident.: DSC-31-27-00001227.0001001 / 09 NOV 20
Applicable to: MSN 01251

The OEB reminder flag may apply to one of the following:
- ECAM procedure only
- ECAM procedure and corresponding status messages
- Status message only.

ONLY PROCEDURE AFFECTED

- The ECAM warning title remains the same
- All corresponding actions are deleted. Instead, the “REFER TO QRH PROC” message appears
- The associated status messages on the ECAM system display remain the same.

COCKPIT INDICATION



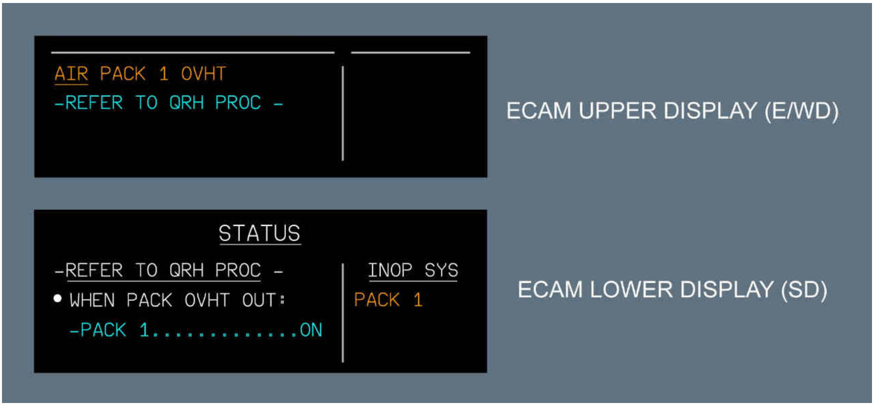
```
AIR PACK 1 OVHT
-REFER TO QRH PROC -
```

```
STATUS
• WHEN PACK OVHT OUT:          INOP SYS
  -PACK 1.............ON       PACK 1
```

PROCEDURE AND STATUS AFFECTED

- The ECAM warning title remains the same
- All corresponding actions are deleted. Instead, the “REFER TO QRH PROC” message appears
- The associated status messages on the ECAM system display remain the same, except for the additional “REFER TO QRH PROC” title.

COCKPIT INDICATION



AIR PACK 1 OVHT
-REFER TO QRH PROC -

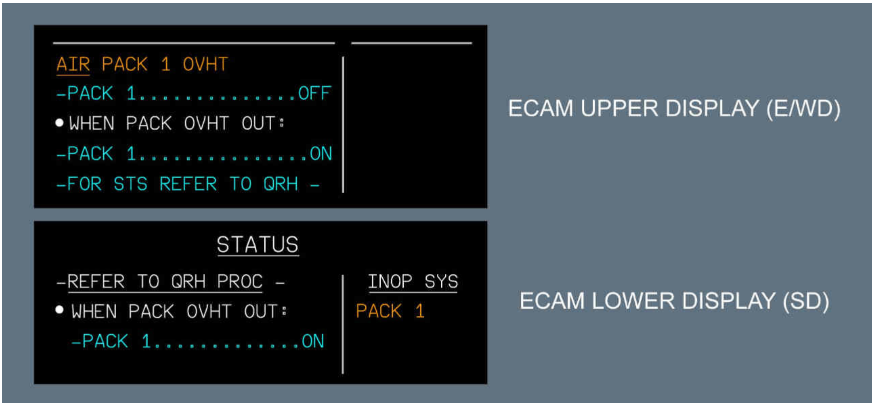
STATUS
-REFER TO QRH PROC -
• WHEN PACK OVHT OUT:
-PACK 1.............ON

INOP SYS
PACK 1

ONLY STATUS MESSAGE AFFECTED

- The ECAM warning title remains the same
- The corresponding procedure remains the same, except for the additional “FOR STS REFER TO QRH” line
- The associated status messages on the ECAM system display remain the same, except for the additional “REFER TO QRH PROC” title.

COCKPIT INDICATION



```
AIR PACK 1 OVHT
-PACK 1..............OFF
• WHEN PACK OVHT OUT:

5

(1) OFF / BRT knobs

Used to turn the ECAM DUs on and off, and to control their brightness (automatic adjustment of brightness for ambient light conditions is superimposed on this manual control).

Note: *When the flight crew turns the UPPER DISPLAY knob to OFF, the engine/warning (E/W) display appears on the lower display unit (automatic transfer).*

(2) System page pushbuttons

- Call up the corresponding system pages on the SD
- Light up, when pushed for manual selection, or when an advisory is detected
- Call up the aircraft system page corresponding to the present flight phase or the current warning when pushed a second time.

When only one ECAM display is on, the flight crew can display a system page for up to 3 min by pushing and holding the system page pushbutton.

- If an advisory condition arises, the relevant system page is not automatically displayed, but the pushbutton light pulses
- If an ECAM warning is triggered, the relevant system page is not automatically displayed, and the system page pushbutton does not light up.

(3) RCL pb

- When pressed, the E/WD displays all alerts previously cleared via the CLR pb that are still active.
- When pressed for more than 3 s, the E/WD displays:
  - All alerts previously cleared via the CLR pb that are still active
  - All alerts previously cancelled via the EMER CANC pb.

Note: *1. If there is no alert to recall, the "NORMAL" message appears for 3 s on the E/WD.*
2. This action on the RCL pb also suppresses the flight phase inhibition function until the next flight phase. As a consequence, all new alerts that should normally be inhibited will be displayed.

(4) STS pb
The flight crew pushes this pushbutton to display the STATUS page on the lower SD. The pushbutton remains lit, as long as the SD displays the STS page. If the system has no status messages, the status page displays "NORMAL" for 3 s.
The flight crew can clear the STATUS page by pushing the CLR pb, or by pushing the STS pb a second time.

When only one ECAM display is on :
- It displays the STATUS page only when the flight crew pushes the STATUS pushbutton and holds it. The flight crew can display the next STATUS page, if any, by releasing the pushbutton and pushing it again (before 2 s have elapsed). The new page then appears after a short delay.
- The flight crew can keep the STS pb pressed to display the STATUS page for a maximum of 3 min, after which the ECAM automatically displays the engine/warning page.

(5) CLR pb
This pushbutton remains lit as long as the E/WD is displaying a warning or caution message, or a status message on the SD.
If it is lit, pressing it changes the ECAM display.

(6) ALL pb
When this pushbutton is pressed and held down, the SD successively displays all the system pages at 3 s intervals.
If the ECAM control panel fails, the flight crew can use this pushbutton to page through the system pages until it reaches the desired page. The flight crew then releases the pushbutton to select that page.

(7) EMER CANC pb

This pushbutton affects the following :

- Warnings :
  - Cancels (stops) an aural warning for as long as the failure condition continues
  - Extinguishes the MASTER WARNINGS lights
  - Does not affect the ECAM message display.
- Cautions :
  - Cancels any present caution (single chime, MASTER CAUTION lights, ECAM message) for the rest of the flight.

The flight crew can press the RCL pb for more than 3 s in order to restore all the alerts previously canceled via the EMER CANC pb.
All the alerts previously canceled via the EMER CANC pb automatically reappear on the E/WD in flight phase 1 or 2, immediately after the alignment of IRs 1 and 2.

Note: This pushbutton should only be used to suppress spurious MASTER CAUTIONS.

(8) T.O CONFIG pb
This pushbutton simulates the application of takeoff power. This is a test that triggers a warning, if the aircraft is not in takeoff configuration. (*Refer to DSC-31-15 Configuration Warnings*).
If the configuration is correct, the E/WD displays the “TO CONFIG NORMAL” message in the TO MEMO section.

Note: If the ECAM control panel fails, the CLR, RCL, STS, EMER CANC, and ALL pushbuttons remain operative, because their contacts are directly wired to the flight warning and display management computers.

ECAM CONTROL PANEL

(2) System page pushbuttons

- Call up the corresponding system pages on the SD
- Light up, when pushed for manual selection, or when an advisory is detected
- Call up the aircraft system page corresponding to the present flight phase or the current warning when pushed a second time.

When only one ECAM display is on, the flight crew can display a system page for up to 3 min by pushing and holding the system page pushbutton.

- If an advisory condition arises, the relevant system page is not automatically displayed, but the pushbutton light pulses
- If an ECAM warning is triggered, the relevant system page is not automatically displayed, and the system page pushbutton does not light up.

(3) RCL pb

- When pressed, the E/WD displays all alerts previously cleared via the CLR pb that are still active.
- When pressed for more than 3 s, the E/WD displays:
  - All alerts previously cleared via the CLR pb that are still active
  - All alerts previously cancelled via the EMER CANC pb.

Note: *1. If there is no alert to recall, the "NORMAL" message appears for 3 s on the E/WD.*
2. This action on the RCL pb also suppresses the flight phase inhibition function until the next flight phase. As a consequence, all new alerts that should normally be inhibited will be displayed.

(4) STS pb

The flight crew pushes this pushbutton to display the STATUS page on the lower SD. The pushbutton remains lit, as long as the SD displays the STS page. If the system has no status messages, the status page displays "NORMAL" for 3 s.
The flight crew can clear the STATUS page by pushing the CLR pb, or by pushing the STS pb a second time.

When only one ECAM display is on :

- It displays the STATUS page only when the flight crew pushes the STATUS pushbutton and holds it. The flight crew can display the next STATUS page, if any, by releasing the pushbutton and pushing it again (before 2 s have elapsed). The new page then appears after a short delay.
- The flight crew can keep the STS pb pressed to display the STATUS page for a maximum of 3 min, after which the ECAM automatically displays the engine/warning page.

(5) CLR pb

This pushbutton remains lit as long as the E/WD is displaying a warning or caution message, or a status message on the SD.
If it is lit, pressing it changes the ECAM display.

(6) ALL pb

When this pushbutton is pressed and held down, the SD successively displays all the system pages at one-second intervals.
If the ECAM control panel fails, the flight crew can use this pushbutton to page through the system pages until it reaches the desired page. The flight crew then releases the pushbutton to select that page.

(7) EMER CANC pb

This pushbutton affects the following :

- Warnings :
  - Cancels (stops) an aural warning for as long as the failure condition continues
  - Extinguishes the MASTER WARNINGS lights
  - Does not affect the ECAM message display.
- Cautions :
  - Cancels any present caution (single chime, MASTER CAUTION lights, ECAM message) for the rest of the flight.

The flight crew can press the RCL pb for more than 3 s in order to restore all the alerts previously canceled via the EMER CANC pb.
All the alerts previously canceled via the EMER CANC pb automatically reappear on the E/WD in flight phase 1 or 2, immediately after the alignment of IRs 1 and 2.

Note: This pushbutton should only be used to suppress spurious MASTER CAUTIONS.

(8) T.O CONFIG pb

This pushbutton simulates the application of takeoff power. This is a test that triggers a warning, if the aircraft is not in takeoff configuration. (*Refer to DSC-31-15 Configuration Warnings*).
If the configuration is correct, the E/WD displays the “TO CONFIG NORMAL” message in the TO MEMO section.

Note: If the ECAM control panel fails, the CLR, RCL, STS, EMER CANC, and ALL pushbuttons remain operative, because their contacts are directly wired to the flight warning and display management computers.

NORM : DMC 1 supplies the CAPT's PFD, the CAPT's ND, and the ECAM's DUs.
DMC 2 supplies the F/O's PFD and the F/O's ND.

CAPT 3 : DMC 3 replaces DMC 1.

F/O 3 : DMC 3 replaces DMC 2.

Note: If a DMC fails, each of its associated DUs displays an “INVALID DATA” message.

(2) ECAM/ND XFR rotary selector
Transfers the system/status display to either the Captain's or the First Officer's ND.
The “ECAM ON ND” message is displayed on the lower ECAM display.

Note: If both ECAM DUs (E/WD and SD) fail, the flight crew may use this switch to transfer the E/WD display to either navigation display. In this case, the “ECAM ON ND” message is not displayed.

(1) MASTER WARN lights

- Flash red for level 3 warning
- Accompanied by an aural warning (continuous repetitive chime, specific sounds or synthetic voice).

(2) MASTER CAUT lights

- Light up steady amber for a level 2 caution
- Accompanied by a single chime.

These lights go out when :
- One pilot presses the light (except for some red warnings, such as the overspeed and stall warnings)
- The warning/caution situation is over
- The pilot presses the CLR pb on the ECAM control panel (except for some red warnings, such as the overspeed and stall warnings).
- The pilot presses the EMER CANC pb on the ECAM control panel.

The aural warnings cease when :
- One pilot presses the MASTER WARN light (except for some red warnings, such as the overspeed and stall warnings)
- The warning situation is over
- The pilot presses the EMER CANC pb on the ECAM control panel.

MAXIMUM SIDESTICK DEFLECT

(1) Sidestick order indication
This symbol is in white, and appears as soon as one engine is started.
It indicates the total of the Captain’s and First Officer’s sidestick orders (shown here as left wing down, pitch up).

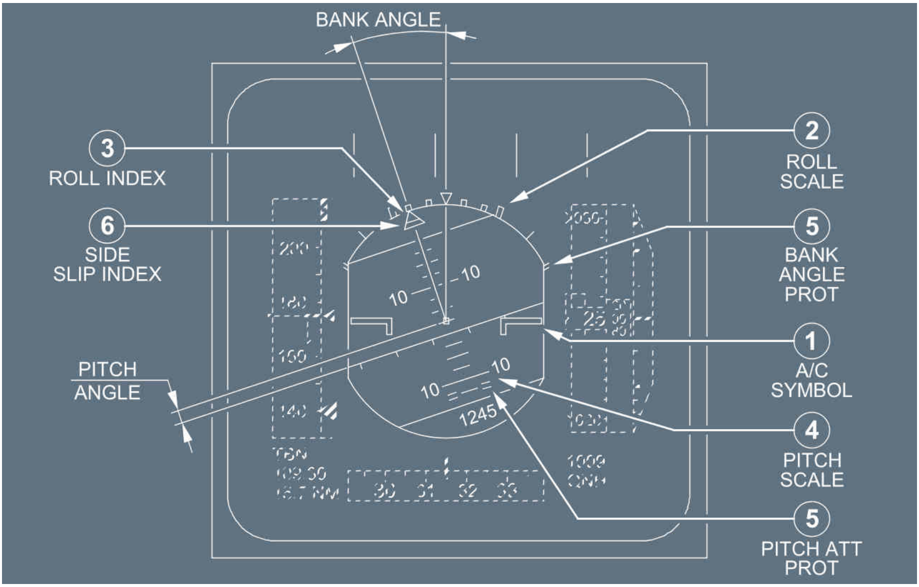
(2) Max Sidestick Deflection
This symbol is in white, and appears as soon as one engine is started.

(3) Ground Roll Guidance Command Bar
This symbol is in green, and appears when the aircraft is on ground, or below 30 ft radio height, provided that a localizer signal is available. It indicates the Flight Director yaw orders, to maintain the aircraft on the runway centerline.

ATTITUDE DATA

Ident.: DSC-31-40-00001234.0004001 / 09 OCT 12

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165



(1) Fixed Aircraft Symbol
This symbol is in black, and outlined in yellow. The yellow outline is dimmed if the flight crew selects TRK-FPA, unless the FMA is in TOGA or FLX mode.

(2) Roll Scale
This scale is in white, and has markers at 0, 10, 20, 30, and 45 ° of bank.

(3) Roll Index (yellow)
This pointer indicates the bank angle. When the bank angle exceeds 45 °, all the PFD symbols except those for attitude, speed, heading, altitude, and vertical speed, disappear. The display returns to normal when the bank angle decreases below 40 °.

(4) Pitch Scale (white)
This scale has markers every 10 ° between 80 ° nose up and 80 ° nose down (every 2.5 ° between 10 ° nose down and 30 ° nose up). When pitch angle exceeds 25 ° nose up or 13 ° nose down, all the PFD displays except attitude, speed, speed trend, heading, altitude, and vertical speed disappear. Beyond 30 °, large red arrowheads indicate that the attitude has

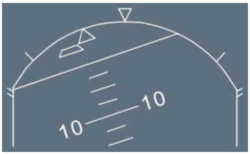
become excessive and show the direction to move the nose in order to reduce it. The display returns to normal when pitch angle becomes less than 22 ° nose up or 10 ° nose down.

(5) Flight Control Protection Symbols

The display shows these symbols (=) in green:
- On the roll scale to mark the bank angle protection availability.
- On the pitch scale at 15 ° nose down or 30 ° nose up to mark the pitch limits.

An amber x replaces these symbols if the corresponding protection is lost.
(*Refer to DSC-27-20-10-20 Protections - General*)

(6) Sideslip Index (yellow)
This trapezoidal index moves beneath the roll index. On ground, it represents the lateral acceleration of the aircraft. In flight, it shows sideslip (as computed by the FAC). One centimeter of displacement indicates 0.2 g. The sideslip index is against its stop at 0.3 g.



In case of engine failure at takeoff or go around, the sideslip index changes from yellow to blue.

Note: *The sideslip target is blue, if:*
- *CONF 1, 2, or 3 is selected, and*
- *Any ENG EPR > 1.25 or one Thrust Lever > MCT (≥ FLX if FLX or DERATED TO), and*
- *The difference between the ENG EPR's exceeds 0.25.*

In this case, the sideslip index is called β target.

When this index is centered with the roll index, the sideslip equals the sideslip target for optimum aircraft performance.

ACTUAL AIRSPEED REFERENCE LINE AND SCALE

A white scale on a grey background moves in front of a fixed yellow reference line (next to a yellow triangle) to indicate airspeed. The minimum airspeed indication is 30 kt.

SPEED TREND

This pointer starts at the speed symbol. The tip indicates the speed that the aircraft will reach in 10 s if its acceleration remains constant. The pointer only appears when it is greater than 2 kt and disappears when it is less than 1 kt.

It also disappears, if the FACs fail.

TARGET AIRSPEED

These symbols give the target airspeed or the airspeed corresponding to the target Mach number.
The target airspeed is either computed by the FMGC in managed speed mode (magenta triangle) or manually entered on the FCU in selected speed mode (blue triangle). The target speed is a magenta double bar (=) when associated with the ECON speed range.
When the target speed is off the speed scale, its value is displayed as numbers, either above or below the speed scale.

MACH NUMBER

It is displayed when it is greater than M 0.5.

SPEED PROTECTION

This symbol indicates the speed (VMO +6 kt or MMO +0.01) at which overspeed protection becomes active (*Refer to DSC-27-20-10-20 Protections - General*).

ECON SPEED RANGE

In descent mode with the ECON/AUTO SPD mode active, these two half triangles replace the selected speed symbol. It shows the upper and lower limits calculated by the FMGC.

- The upper speed is the target speed +20 kt limited to VMAX or VMO -3 kt or MMO -0.006, whichever is the lowest.
  If a speed limit or a speed constraint applies, the upper margin is limited to ECON SPD +5 kt.
- The lower speed margin is the target speed -20 kt limited to green dot, F, S, or VLS, whichever is the highest.

MINIMUM SELECTABLE SPEED (VLS)

The top of the amber strip along the speed scale indicates this speed. It represents the lowest selectable speed providing an appropriate margin to the stall speed.
VLS information is inhibited from touchdown until 10 s after liftoff.

ALPHA PROTECTION SPEED

The top of a black and amber strip along the speed scale indicates this speed.
It represents the speed corresponding to the angle of attack at which alpha protection becomes active (*Refer to DSC-27-20-10-20 Protections - General*).
It is displayed when in pitch normal law.

ALPHA MAX SPEED

The top of a red strip along the speed scale indicates this speed. It represents the speed corresponding to the maximum angle of attack that the aircraft can attain in pitch normal law (*Refer to DSC-27-20-10-20 Protections - General*).
It is displayed when in pitch normal law.

VMAX

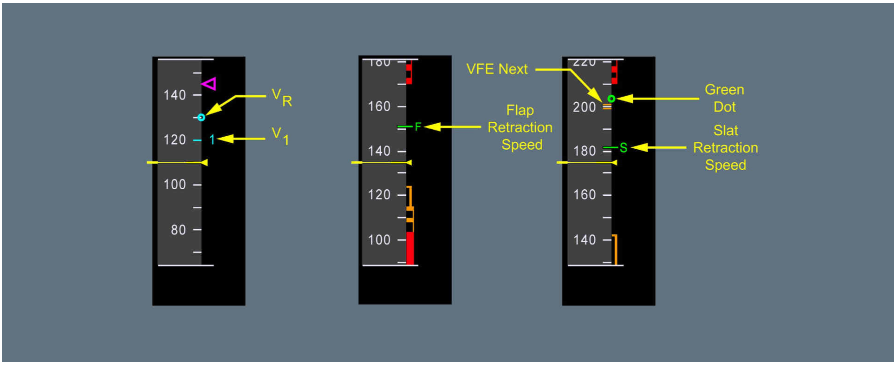
The lower end of a red and black strip along the speed scale defines this speed.

It is the lowest of the following:

- VMO or the speed corresponding to MMO
- VLE
- VFE

STALL WARNING SPEED (VSW)

The top of a red and black strip along the speed scale defines this speed.
It is the speed corresponding to the stall warning (*Refer to DSC-27-20-10-20 Protections - General*).
VSW information is inhibited from touchdown until 5 s after lift-off.
It is displayed when operating in pitch alternate or pitch direct law.



DECISION SPEED (V1)

This speed represented by the number (1) is manually inserted by the flight crew in the MCDU.
When it is off the scale, the upper part of the scale shows it in numbers.
It disappears after lift-off (*Refer to DSC-22_10-50-50 Other Speeds*).

MINIMUM FLAP RETRACTION SPEED

This is represented by a F. It appears when the flap selector is in position 3 or 2.

MINIMUM SLAT RETRACTION SPEED

This is represented by a S. It appears when the flap selector is in position 1.

VFE NEXT

The VFE next symbol is an amber equal sign (=) showing the VFE corresponding to the next flap lever position.
It appears when the aircraft altitude is below 15 000 ft or 20 000 ft depending upon the FAC standard (*Refer to DSC-22_10-50-30 Limit Speeds*).

GREEN DOT (ENGINE-OUT OPERATING SPEED IN CLEAN CONFIGURATION)

This green dot appears when the aircraft is flying in clean configuration.
It shows the speed corresponding to the best lift-to-drag ratio.

ROTATION SPEED (VR)

VR is entered on the PERF takeoff page of the MCDU and is indicated by a cyan circle (o).
This cyan circle is visible during takeoff.

Note: 1. *V2 is represented by the target speed index during takeoff.*
2. *V2 is manually inserted by the flight crew via the MCDU.*

VLS information is inhibited from touchdown until 10 s after liftoff.

ALPHA PROTECTION SPEED

The top of a black and amber strip along the speed scale indicates this speed.
It represents the speed corresponding to the angle of attack at which alpha protection becomes active (*Refer to DSC-27-20-10-20 Protections - General*).
It is displayed when in pitch normal law.

ALPHA MAX SPEED

The top of a red strip along the speed scale indicates this speed. It represents the speed corresponding to the maximum angle of attack that the aircraft can attain in pitch normal law (*Refer to DSC-27-20-10-20 Protections - General*).
It is displayed when in pitch normal law.

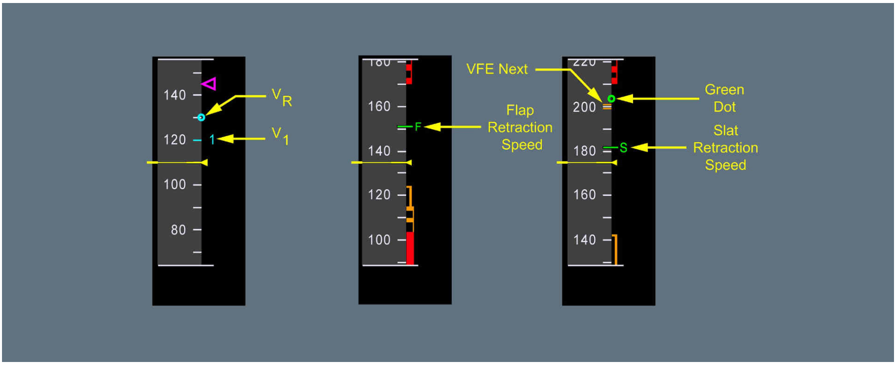
VMAX

The lower end of a red and black strip along the speed scale defines this speed.

It is the lowest of the following:
- VMO or the speed corresponding to MMO
- VLE
- VFE

STALL WARNING SPEED (VSW)

The top of a red and black strip along the speed scale defines this speed.
It is the speed corresponding to the stall warning (*Refer to DSC-27-20-10-20 Protections - General*).
VSW information is inhibited from touchdown until 5 s after lift-off.
It is displayed when operating in pitch alternate or pitch direct law.



DECISION SPEED (V1)

This speed represented by the number (1) is manually inserted by the flight crew in the MCDU.
When it is off the scale, the upper part of the scale shows it in numbers.
It disappears after lift-off (*Refer to DSC-22_10-50-50 Other Speeds*).

MINIMUM FLAP RETRACTION SPEED

This is represented by a F. It appears when the flap selector is in position 3 or 2.

MINIMUM SLAT RETRACTION SPEED

This is represented by a S. It appears when the flap selector is in position 1.

VFE NEXT

The VFE next symbol is an amber equal sign (=) showing the VFE corresponding to the next flap lever position.
It appears when the aircraft altitude is below 15 000 ft or 20 000 ft depending upon the FAC standard (*Refer to DSC-22_10-50-30 Limit Speeds*).

GREEN DOT (ENGINE-OUT OPERATING SPEED IN CLEAN CONFIGURATION)

This green dot appears when the aircraft is flying in clean configuration.
It shows the speed corresponding to the best lift-to-drag ratio.

ROTATION SPEED (VR)

VR is entered on the PERF takeoff page of the MCDU and is indicated by a cyan circle (o).
This cyan circle is visible during takeoff.

Note: *1. V2 is represented by the target speed index during takeoff.*
2. V2 is manually inserted by the flight crew via the MCDU.

ALTITUDE

Ident.: DSC-31-40-00001237.0065001 / 10 MAY 22

7 **Applicable to: MSN 10949-11597**

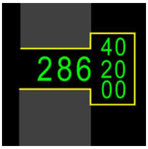
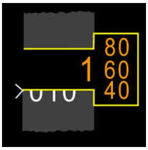
290
286
40
20
00
280
STD
Linear Deviation and Latch Symbol
Target Altitude or Selected Flight Level Symbol
FL120

ALTITUDE INDICATION

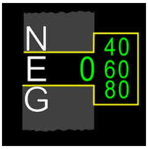
The altitude indication appears both as a white moving scale and as a green digital readout on grey background. Small white marks are positioned on the scale against the round values (e.g. 280, 290,...).



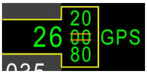
The altitude window is displayed in yellow when the difference between the current altitude and the selected altitude is less than 250 ft.
The altitude window pulses in yellow when the difference between the current altitude and the selected altitude exceeds 250 ft but decreases.
The altitude window flashes in amber when the difference between the current altitude and the selected altitude exceeds 250 ft and increases.
Refer to DSC-31-40 Altitude Alert.



The current altitude is below the MDA (or the MDH) entered in the FMS.



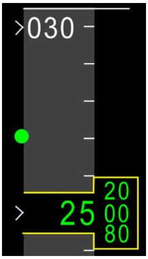
The current altitude is negative.



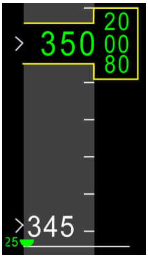
The current altitude is provided by the GPS and no longer by the ADR.

LINEAR DEVIATION AND LATCH SYMBOL

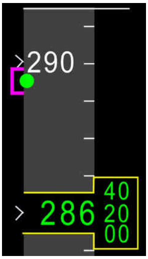
The linear deviation is the difference between the current altitude of the aircraft and the theoretical vertical profile of the FMS.
The linear deviation appears from the top of descent down to the MAP altitude.



When the linear deviation is less than 540 ft, the linear deviation symbol is a green filled circle, located at the theoretical FMS altitude.



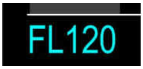
When the linear deviation exceeds 540 ft, the vertical deviation symbol is a green half filled circle, located at the altitude scale limits. In this case, it is associated with the numerical value displayed on two digits, in hundreds of feet. The MCDU PROG page displays the exact value.



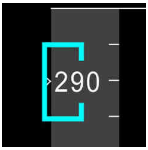
When the aircraft is near to the vertical profile and the FMS provides priority to the vertical profile, the aircraft is “latched on the profile”. This is represented by the Latch symbol (magenta half square). The Latch symbol appears only if the linear deviation is less than 540 ft.

TARGET ALTITUDE OR SELECTED FLIGHT LEVEL SYMBOL

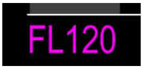
This symbol shows the FCU selected altitude (if QNH BARO reference is selected) or the selected flight level (if STD BARO reference is selected).



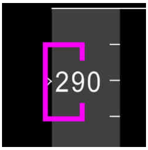
Indicates the selected altitude when the vertical guidance is either selected or managed.
The altitude target is outside the altitude scale.



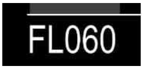
Indicates the selected altitude when the vertical guidance is either selected or managed.
The altitude target is within the altitude scale.



Indicates an altitude constraint when the vertical guidance is managed.
The altitude constraint is outside the altitude scale.



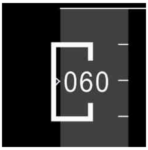
Indicates an altitude constraint when the vertical guidance is managed.
The altitude constraint is within the altitude scale.



Indicates the selected altitude when a vertical approach mode is engaged.

Note: *The aircraft disregards this altitude target when a vertical approach mode is engaged.*

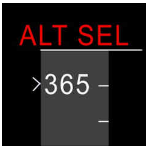
The altitude target is outside the altitude scale.



Indicates the selected altitude when a vertical approach mode is engaged.

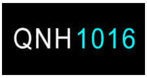
Note: *The aircraft disregards this altitude target when a vertical approach mode is engaged.*

The altitude target is within the altitude scale.

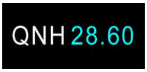


Temporarily flashes then remains steady on the top of the altitude scale when the selected altitude from FCU or the altitude constraint from FMS is not valid.

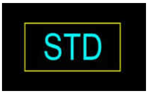
BAROMETRIC REFERENCE



The flight crew selects the QNH pressure reference in hectoPascals on the barometric reference knob of the EFIS CP.



The flight crew selects the QNH pressure reference in inches of mercury on the barometric reference knob of the EFIS CP.



The flight crew selects the standard pressure reference on the barometric reference knob of the EFIS CP.

This indication pulses when the selection made by the flight crew is not correct (STD not selected above transition altitude in climb or STD still selected in approach below transition level).

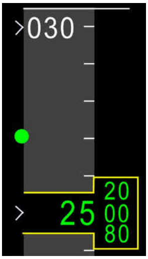
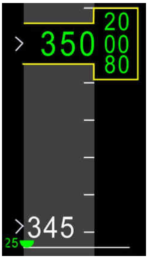
LINEAR DEVIATION

The linear deviation is the difference between the current altitude of the aircraft and the theoretical vertical profile of the FMS.
The linear deviation appears from the top of descent down to the MAP altitude.



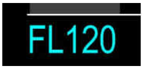
When the linear deviation is less than 540 ft, the linear deviation symbol is a green filled circle, located at the theoretical FMS altitude.



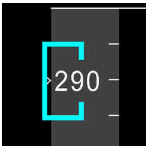
When the linear deviation exceeds 540 ft, the vertical deviation symbol is a green half filled circle, located at the altitude scale limits. In this case, it is associated with the numerical value displayed on two digits, in hundreds of feet. The MCDU PROG page displays the exact value.

TARGET ALTITUDE OR SELECTED FLIGHT LEVEL SYMBOL

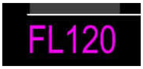
This symbol shows the FCU selected altitude (if QNH BARO reference is selected) or the selected flight level (if STD BARO reference is selected).



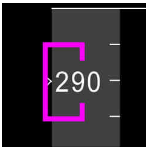
Indicates the selected altitude when the vertical guidance is either selected or managed.
The altitude target is outside the altitude scale.



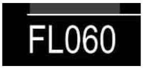
Indicates the selected altitude when the vertical guidance is either selected or managed.
The altitude target is within the altitude scale.



Indicates an altitude constraint when the vertical guidance is managed.
The altitude constraint is outside the altitude scale.



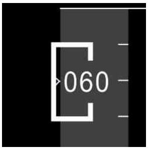
Indicates an altitude constraint when the vertical guidance is managed.
The altitude constraint is within the altitude scale.



Indicates the selected altitude when a vertical approach mode is engaged.

Note: *The aircraft disregards this altitude target when a vertical approach mode is engaged.*

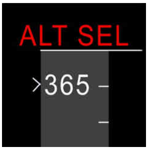
The altitude target is outside the altitude scale.



Indicates the selected altitude when a vertical approach mode is engaged.

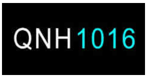
Note: *The aircraft disregards this altitude target when a vertical approach mode is engaged.*

The altitude target is within the altitude scale.

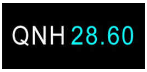


Temporarily flashes then remains steady on the top of the altitude scale when the selected altitude from FCU or the altitude constraint from FMS is not valid.

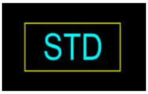
BAROMETRIC REFERENCE



The flight crew selects the QNH pressure reference in hectoPascals on the barometric reference knob of the EFIS CP.



The flight crew selects the QNH pressure reference in inches of mercury on the barometric reference knob of the EFIS CP.



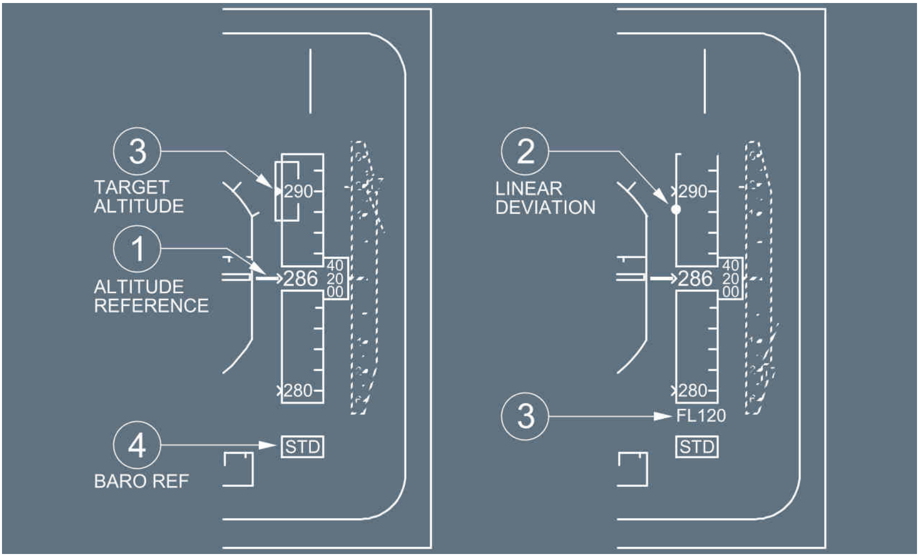
The flight crew selects the standard pressure reference on the barometric reference knob of the EFIS CP.

This indication pulses when the selection made by the flight crew is not correct (STD not selected above transition altitude in climb or STD still selected in approach below transition level).

ALTITUDE

Ident.: DSC-31-40-00001237.0049001 / 29 OCT 13

9 **Applicable to: MSN 02887, 02904-03710, 03733-04773, 04953-05883, 06097, 06121, 06139-06632, 06658-06813, 06876-07005, 08495-09324**



(1) Altitude Indication
This appears both as a white moving scale, and as a green digital readout on a grey background. Small white marks are positioned on the scale against the round values (e.g. 280, 290...). “NEG” appears in the window in white for negative values. The altitude window changes from yellow to amber, if the aircraft deviates from the FCU-selected altitude or flight level.
On any approach for which an minimum is entered in the FMGC, the altitude numbers change from green to amber, when the aircraft goes below the minimum.

(2) Linear Deviation (green filled circle)
This symbol appears next to the altitude corresponding to the theoretical vertical profile computed by the FMGC. It is displayed from the top of descent down to the MAP altitude.

The flight crew can read the linear deviation directly from the altitude scale. The range is ±500 ft. When the linear deviation value exceeds ±500 ft, the symbol stays at the range limit but changes to a half filled circle and the PROG page displays the exact value.

(3) Target Altitude or Selected Flight Level Symbol (blue)
This symbol shows the FCU selected altitude (if QNH BARO reference is selected) or the selected flight level (if STD BARO reference is selected.)
When the FMGC operates in the vertical managed mode, this symbol is magenta if it represents a flight plan altitude constraint that the FMGC will follow. If the target altitude or flight level is on the scale, the symbol is displayed and the numerical value appears inside the symbol.
If it is off the scale, the symbol is not displayed, and the numerical value appears above or underneath the scale.

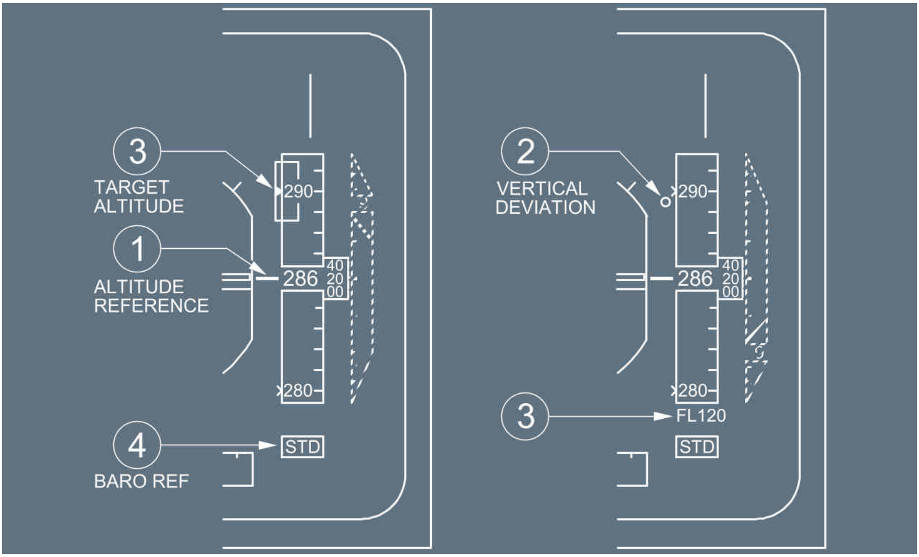
(4) Barometric Reference
The display shows “STD” or it shows “QNH” and the numerical setting in hectoPascals or inches of mercury.
It pulses when the selection made by the flight crew is not correct (STD not selected above transition altitude in climb or STD still selected in approach below transition level).

APPROACH MINIMUM INDICATION

Approach minimum is displayed on the altitude scale by an amber indication.

ALTITUDE

Ident.: DSC-31-40-00001237.0001001 / 27 JUN 12
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321



(1) Altitude Indication
This appears both as a white moving scale, and as a green digital readout on a grey background. Small white marks are positioned on the scale against the round values (e.g. 280, 290...). “NEG” appears in the window in white for negative values. The altitude window changes from yellow to amber, if the aircraft deviates from the FCU-selected altitude or flight level.
On any approach for which an MDA (MDH) is entered in the FMGS, the altitude numbers change from green to amber, when the aircraft goes below the MDA (MDH).

(2) Vertical Deviation (magenta)
This symbol appears next to the altitude corresponding to the theoretical vertical profile computed by the FMGC. It is displayed from the top of descent down to the MAP altitude. The pilot can read the VDEV directly from the altitude scale. The range is ±500 ft. When the VDEV value exceeds ±500 ft, the symbol stays at the range limit and the PROG page displays the exact value.

(3) Target Altitude or Selected Flight Level Symbol (blue)
This symbol shows the FCU selected altitude (if QNH BARO reference is selected) or the selected flight level (if STD BARO reference is selected.)
When the FMGC operates in the vertical managed mode, this symbol is magenta if it represents a flight plan altitude constraint that the FMGC will follow. If the target altitude or flight level is on the scale, the symbol is displayed and the numerical value appears inside the symbol.
If it is off the scale, the symbol is not displayed, and the numerical value appears above or underneath the scale.

(4) Barometric Reference
The display shows “STD” or it shows “QNH” and the numerical setting in hectoPascals or inches of mercury.
It pulses when the selection made by the pilot is not correct (STD not selected above transition altitude in climb or STD still selected in approach below transition level).

ALTITUDE (CONT'D)

Ident.: DSC-31-40-00006121.0001001 / 13 JAN 14

(1) Radio Height

This quantity appears when it is less than 2 500 ft.

- If a DH has been entered, the radio height appears:
  - In green, when DH +100 ft < RA < 2 500 ft
  - In amber, when RA < DH +100 ft

  If “NO” is entered as the DH on the MCDU APPROACH page, 0 ft becomes a default value. When the aircraft reaches the decision height selected on the MCDU, DH letters flash amber for 3 s, then remain amber above the radio height indication.
- If no DH has been entered, or if both FMGCs fail, the radio height appears:
  - In green, when 400 ft < RA < 2 500 ft
  - In amber, when RA ≤ 400 ft

The radio height indication changes every 10 ft down to 50 ft, then every 5 ft down to 10 ft, then every foot.

(2) Landing Elevation (blue)

The horizontal bar on the altitude scale shows the landing elevation at the flight-planned destination.

It is displayed:

- during flight phases 7 and 8 and
- if the QNH reference mode is selected.

(3) Ground reference

A red ribbon on the right of the altitude scale represents the field elevation. This ribbon, which is driven by the radio altimeter signal, is displayed below 570 ft.
It moves up, as does the lower line of the attitude sphere, with the altitude scale as the aircraft descends. When the aircraft has touched down, the top of this ribbon is at the middle of the altitude window.

(1) Radio Height

A value appears, when the aircraft is lower than 2 500 ft.

- If a DH has been entered, the radio height appears:
  - In green, when DH +100 ft < RA < 2 500 ft
  - In amber, when RA < DH +100 ft

  If “NO” is entered as the DH on the MCDU APPROACH page, 0 ft becomes a default value. When the aircraft reaches the decision height selected on the MCDU, DH letters flash amber for 9 s, then remain amber above the radio height indication.
- If no DH has been entered, or if both FMGCs fail, the radio height appears:
  - In green, when 400 ft < RA < 2 500 ft
  - In amber, when RA ≤ 400 ft

The radio height indication changes every 10 ft down to 50 ft, then every 5 ft down to 10 ft, then every foot.

(2) Landing Elevation (brown)

The top of the brown surface on the altitude scale represents the landing elevation at the flight-planned destination.

It is displayed:
- during flight phases 7 and 8 and
- if the STD reference mode is not selected.

(3) Ground reference

A red ribbon on the right of the altitude scale represents the field elevation. This ribbon, which is driven by the radio altimeter signal, is displayed below 570 ft.

It moves up, as does the lower line of the attitude sphere, with the altitude scale as the aircraft descends. When the aircraft has touched down, the top of this ribbon is at the middle of the altitude window.

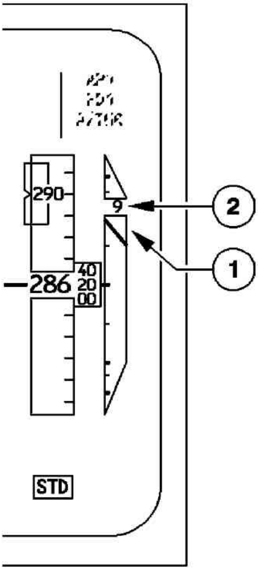
VERTICAL SPEED

Ident.: DSC-31-40-00001239.0001001 / 21 MAR 17

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

The displayed vertical speed information is normally based on both inertial and barometric data. If inertial data is not available, it is automatically replaced by barometric information.

In this case, the window around the numerical value becomes amber.



(1) Analog pointer

This pointer, which is normally in green, points to a white vertical speed scale, displayed on a grey background and graduated at intervals of 500 ft/min.
If the V/S is greater than 6 000 ft/min, the pointer stays at the end of the scale.

(2) Digital indication

This number, normally in green, is the vertical speed in hundreds of feet per minute.
It disappears, if the vertical speed is less than 200 ft/min.

The analog pointer and the digital indication become amber, if:
- V/S is greater than 6 000 ft/min, (climb or descent)
- V/S is greater than 2 000 ft/min, during descent when 1 000 ft < RA < 2 500 ft, or
- V/S is greater than 1 200 ft/min, during descent and RA < 1 000 ft.

Note: *For TCAS, Refer to DSC-34-SURV-60-20 TCAS Messages.*

VERTICAL SPEED

FLIGHT PATH VECTOR

Ident.: DSC-31-40-00001241.0001001 / 17 MAY 21
Applicable to: ALL

The Flight Path Vector (FPV) is the flight reference with the TRK and FPA as basic guidance parameters. When the TRK/FPA is selected on the FCU, the FPV appears on the PFD.

INFORMATION PRESENTATION

The FPV appears on the PFD as a symbol, known as the "bird". The bird indicates the track and flight path angle in relation to the ground.
The track is indicated on the PFD by a green diamond on the compass, in addition to the lateral movement of the bird in relation to the fixed aircraft symbol. On the ND, the track is indicated by a green diamond on the compass scale. The difference in angle between track and heading indicates the drift.
The flight path angle is indicated on the PFD by the vertical movement of the bird in relation to the pitch scale.
With the flight directors (FD) ON, the Flight Path Director (FPD) replaces the HDG-VS Flight Director (FD). With both FD pb set to OFF, the blue track index appears on the PFD horizon.

DRIFT
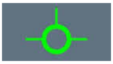
WIND

Example:
The aircraft flies:
- A track of 019° (heading 360°, wind from the left)
- A flight path angle of minus 11°

FLIGHT PATH VECTOR (FPV)



The FPV appears, when the pilot selects TRK/FPA on the FCU.

The flight path vector represents the lateral and vertical trajectory of the aircraft with respect to the ground.
- On the lateral scale, it indicates the aircraft's track.
- On the vertical scale, it indicates the aircraft's flight path angle.

USE OF FPV

The bird is the flying reference that should be used when flying a stabilized segment of trajectory, e.g.: non-precision approach when the FLS function ⩤ is not used or visual circuit.

In dynamic manoeuvres, the bird is directly affected by the aircraft inertia and has a delayed reaction. As a result, the bird should not be used as a flight reference in dynamic manoeuvres. *Refer to FCTM/AS-BIRD Introduction* for more information.

GUIDANCE

Ident.: DSC-31-40-00001242.0001001 / 13 JAN 14
Applicable to: ALL

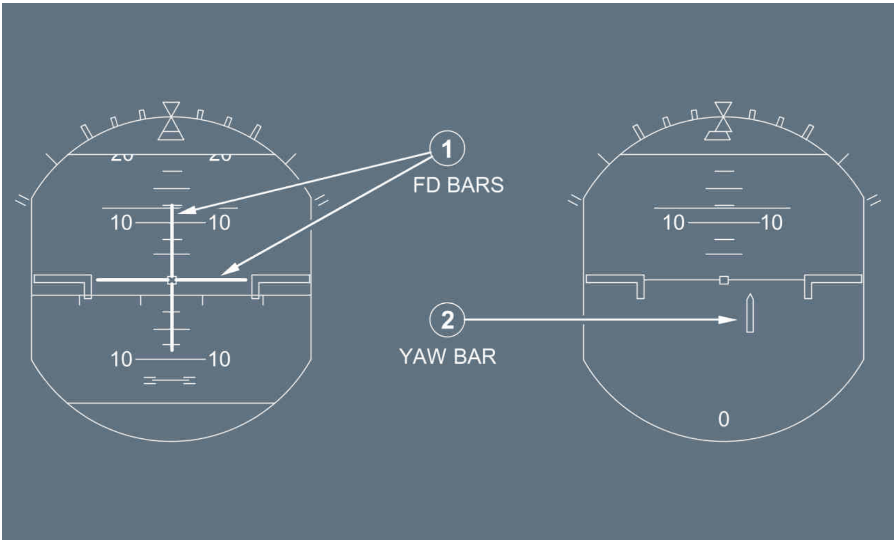
Two completely different flight director modes are available, each with its own characteristic symbols. The symbol displayed corresponds to the basic operating reference the pilot has selected – either HDG V/S or TRK FPA.
In normal operation, PFD1 displays FD1 orders.
If FD1 fails, PFD1 automatically displays FD2 orders on PFD1, the FD2 indication in the right column of the FMA flashes for a few seconds.
This is also applicable to FD2 orders, that are displayed on PFD2.

IF THE CREW HAS SELECTED HDG V/S TO BE THE BASIC REFERENCE:

The PFD displays FD bars in green. They automatically move out of view at touchdown in ROLL OUT mode.

They flash for 10 s, and then remain steady, if the following occur:
- A reversion to the HDG V/S basic mode (manual or automatic), or
- The selected flight level is changed, when ALT CAPTURE mode is engaged, or
- The loss of LOC or G/S in LAND mode or loss of LAND mode, or
- At the first AP or FD engagement.

The PFD displays a yaw bar in green below 30 ft radio height, if a localizer signal is available:
- During takeoff (in RWY mode)
- Upon landing (in FLARE and ROLL OUT mode).



(1) FD Crossed Bars (green)

(2) Yaw Bar (green)

THE CREW HAS SELECTED TRK FPA AS THE BASIC REFERENCE:

An inertial flight path vector defines the aircraft's horizontal and vertical track, taking wind effect into account.
An associated flight path director symbol guides the flight crew onto the vertical and horizontal flight path targets.

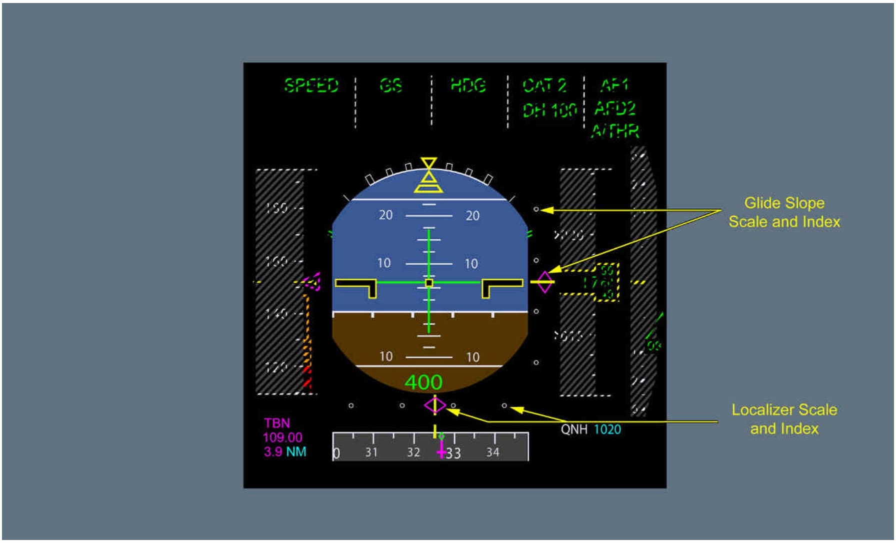
TRAJECTORY DEVIATION

Ident.: DSC-31-40-A-00017532.0001001 / 12 MAY 22
Applicable to: ALL

ILS / GLS ◁ / MLS ◁ / SLS ◁ GUIDANCE MODE



LOCALIZER DEVIATION SCALE AND INDEX

Localizer Deviation Scale and Index

GLIDE SLOPE DEVIATION SCALE AND INDEX

Deviation scales appear as soon as the flight crew presses an LS/ILS pb on the EFIS control panel. Deviation indexes appear when the glide slope and localizer signals of the ILS / GLS ◁ / SLS ◁ (or the elevation and azimuth signals of the MLS ◁) are valid, if deviation scales are displayed.
When a deviation index is out of the displayed range, only half a symbol appears at the end of the scale.
The LOC scale flashes and continues to flash if the deviation exceeds 1/4 dot for two seconds while the aircraft is between 15 ft and 1 000 ft , and CAT2 or CAT3 capability displayed on the FMA, and either LOC, LAND, or FLARE is engaged. The glideslope scale flashes and continues to flash if the deviation exceeds one dot for two seconds (above 100 ft RA).
LOC and the glideslope scale half index symbol flash, and continue to flash, when the deviation exceeds two dots for two seconds.

One dot represents a deviation of ± 0.8 ° on the localizer scale, and ± 0.4 ° on the glideslope scale.

ILS / GLS ◁ / MLS ◁ / SLS ◁ INFORMATION

The following information appears on the PFD, when the flight crew has selected an ILS frequency / GLS channel / MLS channel / SLS channel and course, and pressed the the LS pb
- ILS / GLS / MLS / SLS identification, as decoded by the MMR
- ILS frequency / GLS channel / MLS channel / SLS channel
- For ILS / MLS: DME distance, if the ILS / MLS has a DME
- For GLS / SLS: distance to runway threshold computed by the MMR.

ILS / GLS ◁ / MLS ◁ / SLS ◁ COURSE POINTER

The pointer appears on the PFD, when the flight crew has selected an ILS frequency / GLS channel / MLS channel / SLS channel and course, and pressed the LS pb.
It is a dagger-shaped symbol on the heading scale.
The ILS / GLS / MLS / SLS course pointer is replaced by digits on the right or left hand of the heading scale, when the ILS / GLS / MLS / SLS course value is outside the displayed portion of the heading scale.

MARKER INDICATIONS

OM appears, when the aircraft flies over the outer marker.
MM appears, when the aircraft flies over the middle marker.
IM appears, when the aircraft flies over an airways marker beacon on the ILS / GLS ◁ inner marker.

LS MESSAGE

LS flashes, when the APPR mode is armed, but the LS pb is not selected.

SELECTED APPROACH

The ILS / GLS ◁ / MLS ◁ / SLS ◁ indication is displayed according to the approach selected by the flight crew.

LS/ILS MESSAGE

(1) ILS/MLS ◁ information (magenta)

The following information appears on the PFD, when the crew has selected an ILS frequency/MLS channel and course, and pressed the LS pb:
- ILS/MLS identification, as decoded by the ILS/MLS receiver;
- ILS frequency/MLS channel;
- DME distance, if the ILS/MLS has a DME

(2) ILS/MLS ◁ course Pointer (magenta)

This pointer appears on the PFD, when the crew has selected an ILS frequency/MLS channel and course, and pressed the LS pb.
It is a dagger-shaped symbol on the heading scale.

The ILS/MLS course pointer is replaced by digits on the right or left hand of the heading scale (in a white box) when the ILS/MLS course value is outside the displayed portion of the heading scale.

(3) Marker Indications
OM appears in blue, when the aircraft flies over the outer marker.
MM appears in amber, when it flies over the middle marker.
AWY appears in white, when it flies over an airways marker beacon or the ILS/MLS inner marker.

(4) LS/ILS Message
This flashes amber, when the APPR mode is armed, but the LS pb has not been selected.

(5) Selected approach
The ILS or MLS ◁ indication is displayed in magenta according to the approach selected by the crew.

VERTICAL DEVIATION SCALE AND INDEX
1
LATERAL DEVIATION SCALE AND INDEX
2
3
FINAL LEG COURSE

(1) Vertical Deviation Scale and Index

The vertical deviation is displayed if:
1. A non precision approach is entered in the Flight Plan
2. LS pb is not pressed
3. FINAL descent mode is armed or engaged
4. Approach phase is active or aircraft is in the FMS approach area (5 NM to the first approach waypoint).

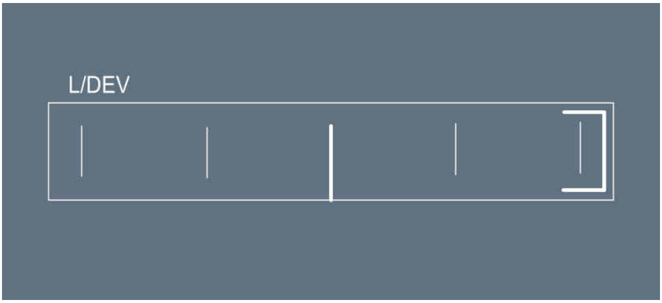
Each vertical deviation scale graduation represents 100 ft, the range being ± 200 ft. Vertical deviation index is displayed until MDA has been reached or MAP or RWY has sequenced.

(2) Lateral Deviation Scale and Index
The lateral deviation is displayed if:

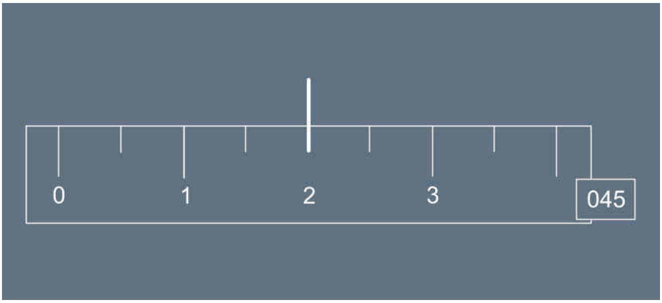
1. LS pb is not pressed
2. GPS primary is installed
3. RNP is equal or less than 0.3
4. LDEV suits to RNP AR operations.

Each lateral deviation scale graduation represents 0.1 NM, the range being + or – 0.2 NM on each side. An index represents the lateral deviation, when the value is less than 0.2 NM. When out of range, the index is replaced by a half index at the scale limit.

Note: *The lateral deviation scale and index can also be displayed on takeoff and missed approach if the same conditions as above are met.*



(3) FINAL Leg Course
The inbound course of the last approach leg is displayed on the heading scale in magenta. When outside the range, the symbol is replaced by a digital value in magenta, and located at the limit of the heading area.



Note: *If the LS pb is pressed, glide and LOC deviation has priority over vertical and lateral deviation information. As long as VDEV and L/DEV display conditions are met, and the LS pb is selected, an amber VDEV and L/DEV message flashes above the glide scale.*

VERTICAL DEVIATION SCALE

(1) Vertical Deviation Scale and Index
These symbols appear when in the approach phase and, when either FINAL is armed/engaged or a non-LS approach has been entered. They are displayed in the

approach or go-around phase, until the MDA has been reached, or the MAP or the runway has been sequenced. They give the vertical deviation from the trajectory defined by the FMGC. Each index scale graduation represents 100 ft. The range is ± 200 ft.

Note: If the LS pb is pressed, glide deviation has priority over vertical deviation information. As long as VDEV display conditions are met, and the LS pb is selected, an amber VDEV message flashes above the glide scale.

Ident.: DSC-31-40-A-00001245.0022001 / 09 OCT 12

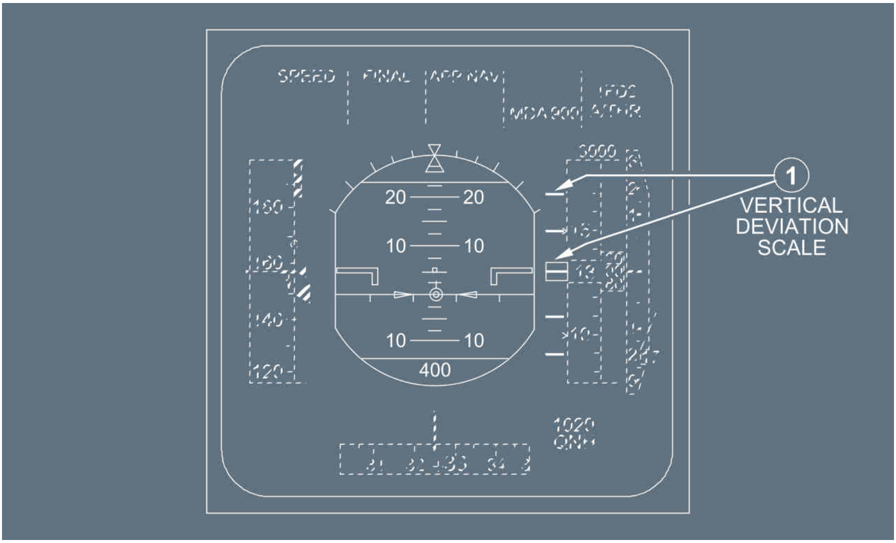
NON PRECISION APPROACH



(1) Vertical Deviation Scale and Index
These symbols appear when in the approach phase and, when either FINAL is armed/engaged or a non-LS approach has been entered. They are displayed in the approach or go-around phase, until the MDA has been reached, or the MAP or the runway has been sequenced. They give the vertical deviation from the trajectory defined by the FMGC. Each index scale graduation represents 100 ft. The range is ± 200 ft.

Note: If the LS pb is pressed, glide deviation has priority over vertical deviation information. As long as VDEV display conditions are met, and the LS pb is selected, an amber VDEV message flashes above the glide scale.

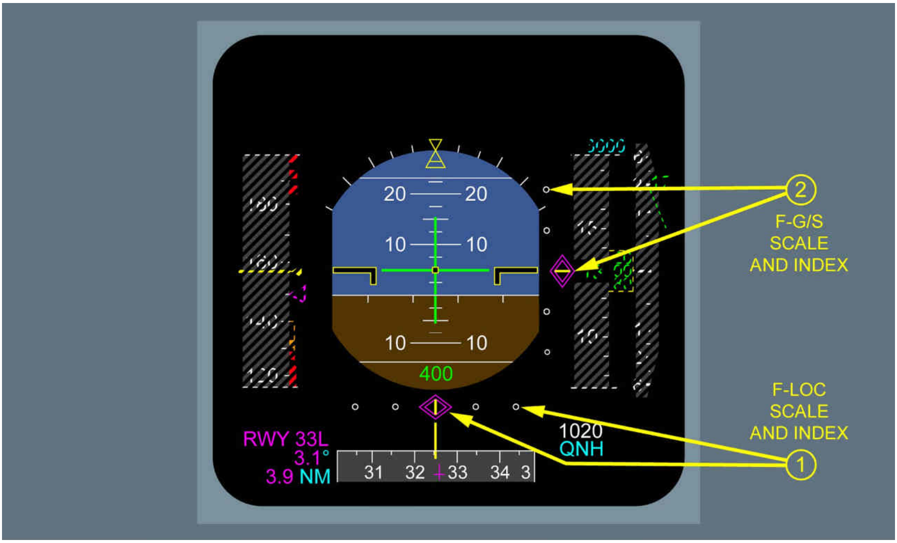
Applicable to: MSN 11531

NON PRECISION APPROACHES USING FLS FUNCTION



(1) F-LOC or LOC Deviation scale and Index

(2) F-G/S deviation scale and index

Deviation scales appear as soon as the flight crew pushes an LS pb on the EFIS control panel.
Deviation indexes (double diamond) appear, when the deviations are valid, if deviation scales are displayed. When a deviation index is out of the displayed range, only half a symbol appears at the end of the scale.
The LOC scale flashes and continues to flash if the deviation exceeds 1/4 dot for two seconds (above 15 ft RA). The glide scale flashes and continues to flash, if the deviation exceeds one dot for two seconds (above 100 ft RA).
“LOC” and the glide scale half index symbols flash and continue to flash, when the deviation exceeds two dots for two seconds. One dot represents a deviation of ± 0.8 ° on the localizer scale and ± 0.4 ° on the glideslope scale.

When a LOC only approach is selected:
- ″LOC″ and ″F-G/S″ (magenta) are displayed above the deviation scales
- The LOC deviation index is a single diamond.

MESSAGE

(1) Selected Landing Systems information (magenta)

The following information appears on the PFD, when the crew has selected a Non Precision approach using FLS and pushed the LS pb

- For VOR, VOR/DME, NDB, NDB/DME on RNAV approach:
  - The FLS anchor point ident:
    - RWYXXX if anchor point is on the runway
    - EPXXX if anchor point is not on the runway
    - The FLS beam slope
    - The distance to anchor point.
- For LOC only or ILS G/S OUT approach:
  - ILS LOC identification
  - LOC frequency
  - DME Distance.

(2) Course Pointer (magenta)

This pointer appears on the PFD, when the crew has selected an NPA approach using FLS function, and pushed the LS pb. It is a dagger-shaped symbol on the heading scale (with double line for FLS course). The LS course pointer is replaced by digits on the right or left of the heading scale (in white box), when the LS course value is outside the displayed portion of the heading scale.

(3) Marker Indications

OM appears in blue, when the aircraft flies over the outer marker. MM appears in amber, when it flies over the middle marker. IM appears in white, when it flies over an airways marker beacon or the ILS/GLS ◁ /MLS ◁ inner marker.

(4) LS Message
This flashes amber, if the APPR mode is armed, but the LS pb has not been selected.

(5) Selected approach reminder
The FLS indication is displayed in magenta if a non precision approach using FLS for vertical navigation is selected.

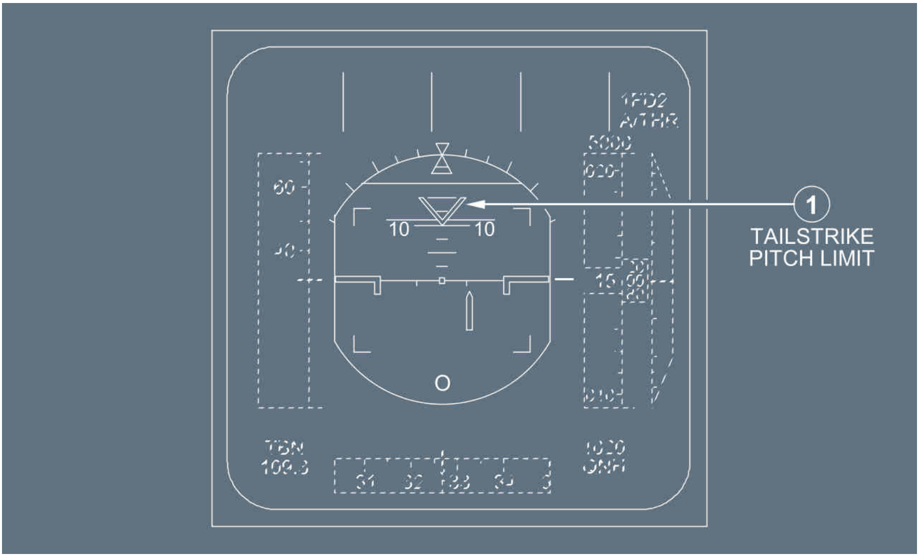
TAILSTRIKE PITCH LIMIT INDICATOR ⊲

Ident.: DSC-31-40-00017534.0003001 / 21 MAR 16
Applicable to: ALL



(1) Tailstrike Pitch Limit
The pitch limit indicates the maximum pitch attitude to avoid the tailstrike risk at landing. The indication is a fixed value corresponding to the main landing gear compressed. The indication appears at 400 ft radio height. The indication disappears, when there is no longer a risk of tailstrike.

ALTITUDE ALERT

Ident.: DSC-31-40-00001247.0002001 / 22 MAY 12
Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

The FWC generates an altitude warning (C chord sound and PFD’s altitude window pulses in yellow or flashes in amber), when the aircraft approaches a preselected altitude or flight level, or when it deviates from its selected altitude or flight level.
This warning results from a comparison between the altitude (ADIRS) and the preselected altitude displayed on FCU.

There are five different displays (five modes to display navigation information):
- ROSE LS
- ROSE VOR
- ROSE NAV
- ARC
- PLAN.

The ND can provide a weather radar image in all modes, except PLAN.

Note: *In order to limit power consumption and prevent a DU overheat, the ND will not display the weather radar image and the terrain display in the following cases:*
- *The avionics ventilation is not sufficient (e.g. due to a blower and extract fan failure)*
- *The ND unit temperature exceeds a defined threshold.*

Any additional increase in temperature will lead to a complete cut off of the power supply to this DU.

GENERAL

Ident.: DSC-31-45-00001249.0003001 / 21 MAR 16

1 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

There are five different displays (five modes to display navigation information) :
- ROSE LS
- ROSE VOR
- ROSE NAV
- ARC
- PLAN

The Navigation Display (ND) can provide a weather radar image in all modes, except PLAN.

NAVAID

(1) Aircraft symbol (yellow)
Fixed and centered in the display, this symbol points to the yellow lubber line.

(2) Aircraft heading
The fixed yellow lubber line points to the aircraft magnetic heading on the moving white compass rose. Small white triangles are fixed at 45 ° intervals on the circumference of the compass rose.
“TRU” appears at the top of the compass rose, when it is displaying true heading instead of magnetic heading (latitude above 73 ° North or 60 ° South).

(3) Selected heading or track (blue)
This pointer shows the heading or track indicated on the FCU's HDG TRK counter.

(4) Actual aircraft track (green)
This symbol is a small green diamond.

(5) Ground speed and true air speed (green)
ADIRS furnishes these speeds.

(6) Wind direction and speed

ADIRS provides the wind direction and speed. The digital direction reflects the true north reference, and the analog direction (indicated by the green arrow) reflects the magnetic north reference. The green arrow only appears, if the wind speed is above two knots.
If the display does not receive either wind speed or direction, dashes replace the numbers on the display.

(7) NAVAIDs

When the ADF-OFF-VOR selector switch on either the pilot's or copilot's EFIS control panel is set to ADF or VOR, the onside ND displays the following characteristics of the corresponding NAVAID in white for VOR or in green for ADF (left side for receiver 1 and right side for receiver 2):

- Type of NAVAID (ADF or VOR)
- Shape and color of the associated bearing pointer (if the bearing pointer is in view).
- NAVAID identification (or frequency by default)
- DME distance if a DME is collocated with the selected VOR. ADF and DME distance are never displayed at the same time.
- Mode of tuning
  - M for a NAVAID tuned manually by the pilot through the MCDU (underlined and dimmed),
  - R for a NAVAID tuned from an RMP (Radio Management Panel) (underlined and dimmed),
  - Nothing for a NAVAID tuned automatically by the FMGC.

If reception fails, the ND stops displaying the associated data (except for the identification or frequency).

(8) Bearing pointer (green for ADF, white for VOR)

This pointer appears when bearing data is available.
If the aircraft is not receiving the beacon or if a receiver fails, the associated bearing pointer disappears.

(9) Chronometer Indication (white)

These numbers appear when the onside chronometer is started.
They display the elapsed time.
The indication is in minutes and seconds from 0 to 59 min 59 s, and in hours and minutes from 1 h to 99 h 59 min (Seconds are not displayed beyond 59 min 59 s.).

(10) Range marks

The range scale value selected on the EFIS control panel (10 to 320 NM) governs the scale of the ND.

(1) ILS Course Pointer (Magenta)
This symbol points at the selected ILS course.
The ILS is either selected by the FMGC (autotuned or manually) or manually selected by the flight crew via the RMP backup mode. If no course has been entered, the default value is 360 °.

(2) Localizer Deviation Bar (Magenta)
This bar moves laterally with respect to the course pointer. Its scale has two white dots on each side of the zero deviation. Each dot corresponds to a deviation of approximately ±0.8 °.
If the lateral deviation exceeds 1/4 dot (0.2 °) above 15 ft RA, both the bar and the scale flash.

(3) Glide Deviation (Magenta)
This diamond moves on a vertical scale that has two white dots on each side of the yellow reference line. Each dot corresponds to a deviation of approximately ±0.4 °.
If the deviation exceeds one dot above 100 ft RA, both the scale and the diamond flash.

(4) Selected ILS Information
This area displays the ILS frequency (magenta), selected course (magenta), and identification (magenta).

(5) ILS Message (Green)

This message indicates the full runway name of the selected approach. This message appears:
- The flight crew selects an ILS approach on the MCDU, and
- The FMS flight phase is DES, APP or GA, or the FMS phase is CRZ and the along track distance to destination is less than 250 NM.

Note: *ILS 1 information appears on PFD 1 and ND 2.*
ILS 2 information appears on PFD 2 and ND 1.

COURSE POINTER

This symbol points at the selected LS course.
The ILS/GLS/SLS ◁ is either selected by the FMGC (autotuned or manually) or manually selected by the flight crew via the RMP backup mode (ILS/GLS only). If no course has been entered, the default value is 360 °.
During an NPA flown with the FLS function for lateral guidance, the course pointer is a magenta dagger with double lines.

LOCALIZER DEVIATION BAR

This bar moves laterally with respect to the course pointer. Its scale has two white dots on each side of the zero deviation. Each dot corresponds to a deviation of approximately ±0.8 °.
If the lateral deviation exceeds 1/4 dot (0.2 °) above 15 ft RA, both the bar and the scale flash.
During an NPA flown with the FLS function for lateral guidance, a double deviation bar appears.

GLIDE AND PSEUDO GLIDE DEVIATION

This diamond (double diamonds for FLS) moves on a vertical scale that has two white dots on each side of the yellow reference line. Each dot corresponds to a deviation of approximately ±0.4 °.
If the deviation exceeds one dot above 100 ft RA, both the scale and the diamond flash.

SELECTED LS INFORMATION

This area displays:

1st line	:	The selected LS approach (ILS, GLS, SLS ◁ , FLS or LOC/FLS), followed by the FLS slope (2 digits, magenta) or the ILS frequency (3 digits) or the SLS ◁ / GLS channel
2nd line	:	The selected course (magenta)
3rd line	:	The anchor point identification (for FLS) or the ILS / SLS ◁ / GLS identification (for ILS / GLS / SLS ◁ or LOC only approach).

APPROACH IDENTIFICATION

This message indicates the full runway name of the selected approach. This message appears when:

- The flight crew selects an LS approach on the MCDU, and
- The FMS flight phase is DES, APP or GA, or the FMS phase is CRZ and the along track distance to destination is less than 250 NM.

Note: *MMR 1 information appears on PFD 1 and ND 2.*
MMR 2 information appears on PFD 2 and ND 1.

LOC AND F-G/S TITLE

When the flight crew selects a LOC only approach, both LOC and F-G/S appear above the deviation scales.

(1) VOR Course Pointer (Cyan)
This symbol points at the selected VOR course.
The VOR course is either automatically selected by the FMGC or manually selected by the flight crew via the MCDU pages or the RMP backup mode.

(2) Lateral Deviation Bar (Cyan)
This bar indicates the VOR deviation on a lateral scale.
Each dot corresponds to 5 ° of lateral deviation. When the lateral deviation exceeds 10 °, the bar remains displayed on the outer dot.
The arrow on the bar provides the TO/FROM indication.

(3) VOR Information (White and cyan)
This area displays the frequency and identification (if decoded by the receiver) of the selected VOR in white, the selected course in cyan, and the tuning mode in white.

(4) VOR or GPS Message (Green)
VOR 14L appears when the flight crew selects a VOR approach on the MCDU.
GPS 14L appears when the flight crew selects a GPS approach.

RANGE MARKS AND VALUES

The values displayed on the ND are:

In ROSE NAV mode	1/4 of the selected range for the inner circle.
	1/2 of the selected range for the heading scale circle.
In ARC mode	1/4 of the selected range for the first inner arc.
	1/2 of the selected range for the second inner arc.
	3/4 of the selected range for the third inner arc.

Ident.: DSC-31-45-A-00023606.0001001 / 26 NOV 19
Applicable to: ALL

FLIGHT PLAN

The flight crew can use the MCDU to select all of the following types of flight plan:

- The active flight plan (the flight plan the aircraft follows when the NAV mode is engaged) is indicated by a continuous green line. The ND indicates only the part of the flight plan that is ahead of the aircraft. In addition, the ND indicates the waypoints that are still to be overflown and the waypoint that the aircraft left from.
  The ND does not indicate a SID or a STAR, except for the last waypoint of the SID and the first waypoint of the STAR, when the selected range is 160 or 320 NM.
  If the primary flight plan is not active, it is indicated by a dotted green line.
- Missed approach procedure
  The missed approach procedure is indicated by a continuous blue line.
- Alternate
  The flight plan to the alternate is indicated by a dashed blue line.

  The missed approach and the alternate flight plan appear when:
  - In ARC or ROSE NAV mode, a missed approach waypoint or an alternate flight plan waypoint is displayed on the onside MCDU
  - In PLAN mode, a missed approach or alternate waypoint is displayed in the 2L field of the onside MCDU.
- The secondary flight plan
  The ND continues to display the active flight plan. The secondary flight plan is indicated by a continuous white line.
- Temporary flight plan
  The revised portion of the flight plan is indicated by a dotted yellow line.
- Flight plan capture
  When the aircraft is off the primary flight plan and flies toward it in HDG mode with the NAV mode armed, the ND indicates the new active flight plan as a continuous green line, if the FMGC computed the intercept path.
  The part of the flight plan before the interception point is indicated as a dotted green line.

Level Symbol + T/D Symbol
ALT CSTR
Intercept Point

The ND can display all of the following types of waypoints:

- Flight plan waypoints
  The ND displays these as green diamonds (white, for TO waypoints). When the flight crew selects the WPT option on his EFIS control panel, all waypoints other than flight plan waypoints are displayed in magenta.
- Pseudo waypoint
  Point of the flight path where the aircraft is predicted to reach a selected altitude or speed. *Refer to DSC-22_20-40-30 Predictions Displayed on the Navigation Display (ND)*.
- Constraint values
  When the flight crew presses the CSTR pb on the EFIS CP, the ND displays the constraints values below the waypoint ident.

  If there are several constraints for the same waypoint, the ND displays the constraints in the following order of priority:
  - The altitude constraint

    The ND displays the altitude constraint value:
    - In FL, when the altitude is above the transition altitude or the barometric setting is set to STD
    - In feet in all other cases.
  - The speed constraint
    The ND displays the speed constraint value in knots or as a Mach number.
  - The time constraint.

  Note: *1. For ILS approaches, the ND only displays speed and time constraints at the FAF waypoint up to destination.*
  2. The ND is limited to the display of 3 lines of constraints for each waypoint. Therefore immediately after the fourth constraint is applied on the FMS:
  - *With FMS Thales, the fourth constraint is not displayed on ND*
  - *With FMS Honeywell, the waypoint ID and all associated constraints disappear from the ND.*

  In both cases, all constraints are correctly managed by the FMS. The flight crew can refer to the MCDU F-PLN page to check all constraints associated with a waypoint.

  The constraint value and the constraint symbol have identical color coding.

  Note: *In PLAN mode, and at the MRP waypoint, the ND also displays the track and the distance to the next waypoint.*

Ident.: DSC-31-45-A-00023609.0001001 / 26 NOV 19
Applicable to: ALL

TO WAYPOINT

This is the next waypoint that the aircraft will overfly.

L2 With the FMS standard Release 1A, when a DIR TO with ABEAM PTS is performed, the DIR TO waypoint appears on the top of the screen, instead of the NEXT ABEAM waypoint.

L1 This area of the screen also indicates all of the following:
- Waypoint identification
- Track to go
- Distance to go
- Estimated time of arrival, with the assumption that the aircraft will directly fly from its present position to the TO waypoint at the current ground speed.

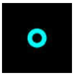
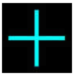
NAVAIDS

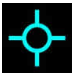
The display uses all of the following specific symbols for NAVAIDs:



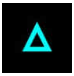
DME or TACAN



VOR



VOR/DME



NDB

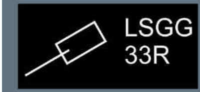
The symbol can appear in all of the four following colors:
- In green if the NAVAID is a current waypoint of the flight plan
- In white if it is the TO waypoint
- In blue when the NAVAID is tuned for display, either automatically by the FMGC, or manually via the MCDU
- In magenta when the NAVAID is not part of the flight plan and is displayed as an option (corresponding option pushbutton pressed on the FCU EFIS control panel).

Ident.: DSC-31-45-A-00023611.0001001 / 26 NOV 19
Applicable to: ALL

AIRPORT

Airport included in the flight plan:

- If the runway is not specified, the airport is indicated by a star and the identification is displayed in white
- If the runway is specified, it is indicated by an oriented runway symbol in white.



The runway is drawn to scale (paved length) if the selected range is 10, 20 or 40 NM.

Optional airport information

The airports that are not displayed as part of the flight plan may be displayed (ARPT pb on the EFIS control panel).
They are indicated by a star and the identification in magenta.

ILS/GLS ◁ MARKER BEACONS

The screen indicates these as waypoints (diamonds).

When the aircraft overflies a marker beacon, the corresponding symbol flashes::

OM	The aircraft is over the outer marker
MM	The aircraft is over the middle marker
IM	The aircraft is over the inner marker.

CROSS TRACK ERROR

This is the lateral deviation of the aircraft from the active leg of the flight plan (related to the great circle route). It is indicated in nautical miles (NM), with the letter R (right) or L (left), according to the position of the aircraft compared to the flight plan.

The following are the conditions of display:

1. The cross-track error is displayed with a precision of one digit (0.1 NM), when the cross-track error is strictly more than 0.29 NM
2. The cross-track error is displayed with a precision of two digits (0.01 NM), from 0.02 NM to 0.29 NM
3. When displayed, the cross-track error is removed when it becomes less than 0.01 NM.

When the current RNP is strictly above 0.3 NM:

1. The cross-track error is displayed with a precision of one digit (0.1 NM)
2. When displayed, the cross-track error is removed when it becomes less than 0.01 NM.

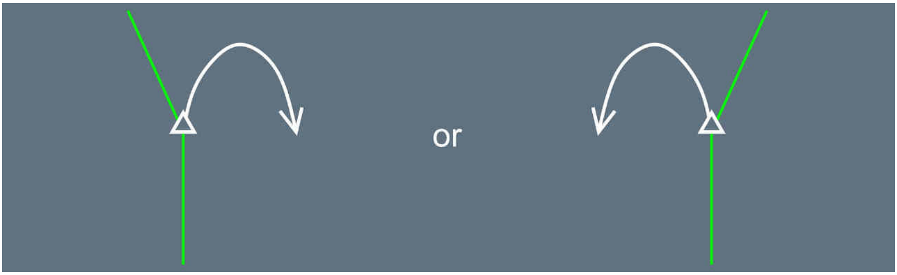
PROCEDURE TURNS AND HOLDING PATTERNS

These only appear when they are part of the flight plan. For the 160 and 320 NM range scales, each one is indicated by a white arrow that originates at the associated fix and indicates the direction of the turn.



For shorter range scales, and if the procedure turn or the holding pattern is in the next or the active leg, the display indicates the full circuit or pattern.

Applicable to: MSN 04827-04860

MINIMUM OFF ROUTE ALTITUDE (MORA)

Provided that CSTR is selected and range is selected equal to or above 40 NM, a digital readout (Flight Level) is displayed. This Flight Level indicates the Minimum Off Route Altitude (MORA) permitted, within a circular area centered on the present aircraft position and bounded by 40 NM of radius limit. If the MORA is not available in the FMGS database for the chosen flight route, nothing is displayed.

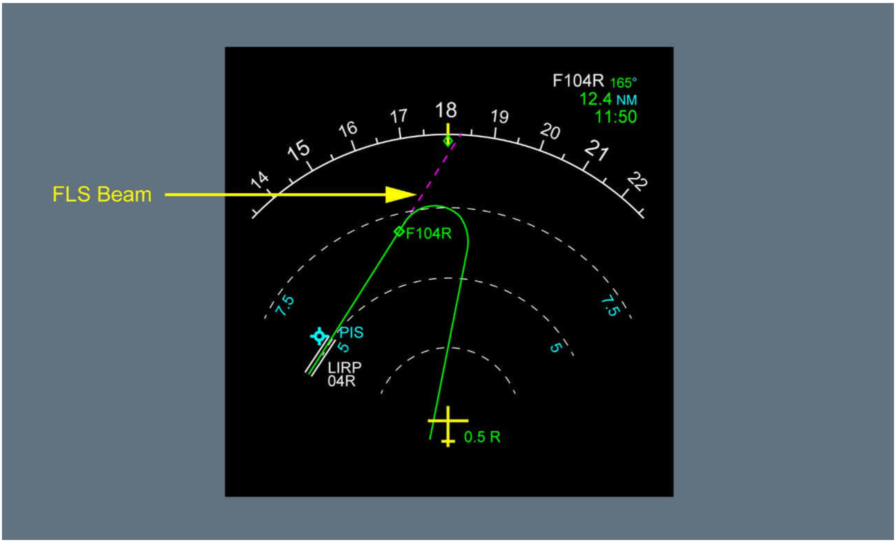
FLS BEAM

The FLS beam of the Non-Precision Approaches (NPA) is indicated with a magenta dotted line. This FLS beam appears when the flight crew has performed all of the following:

- Selected an NPA, in the active flight plan
- Pressed the LS pb on the EFIS CP
- Selected an ND range that is less than or equal to:
  - 80 NM in ARC, or
  - 160 NM in ROSE-NAV mode.

If the anchor point of the FLS beam is not defined at the runway threshold, the anchor point ident (EPXXX) is displayed.



PLAN MODE

8 Ident.: DSC-31-45-00001254.0003001 / 29 NOV 19
Applicable to: MSN 11531

This mode statically displays the flight plan legs on a map oriented to true north. The map is centered on a map reference point, that the pilot selects by scrolling to it on his MCDU.
The map reference point is the waypoint displayed on the second line of the MCDU's F-PLN page. It can either be the active waypoint (next waypoint to be overflown), or any other waypoint of the flight plan.
The pilot can scroll through the overall flight plan, and display it in PLAN mode.
The pilot chooses the scale of the map with the range selector (the diameter of the outer circle corresponds to the selected range).
Data on NAVAIDs and on their characteristics and associated bearing pointers are not available in this mode.

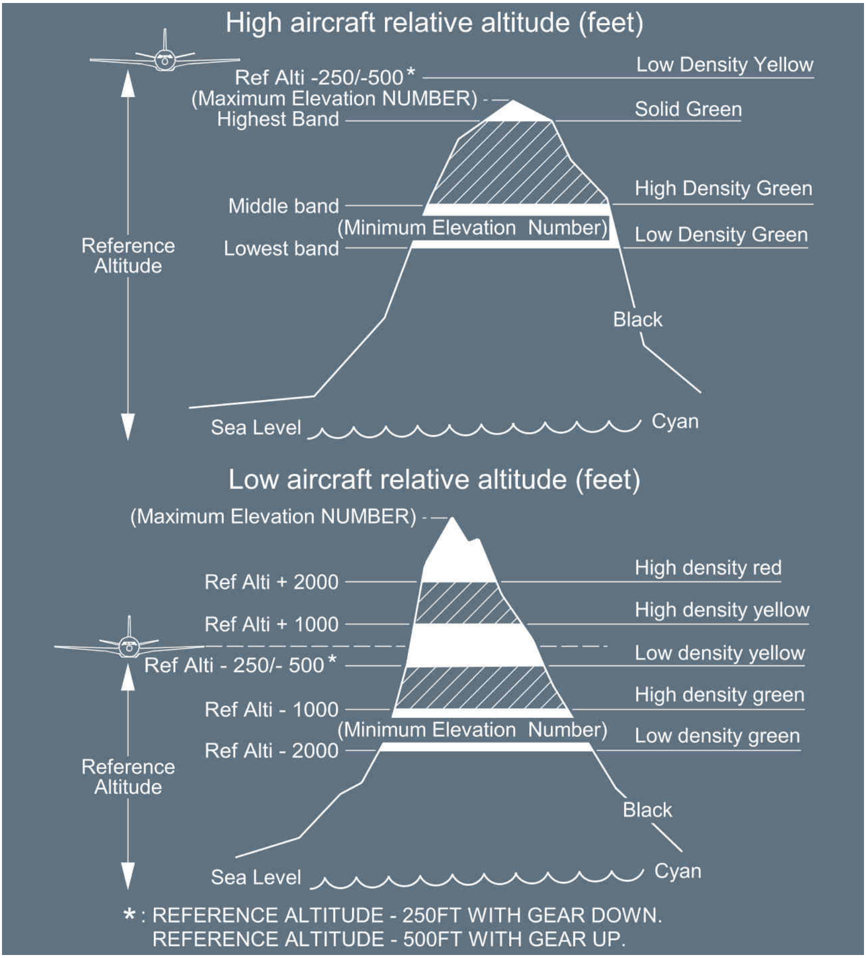
(1) EGPWS terrain picture

The ND displays the EGPWS terrain picture, when the TERR ON ND switch is selected ON, and the ND is not in PLAN mode. The terrain picture replaces the weather radar image. Terrain data is displayed independently of the aircraft relative altitude.

The terrain appears in different colors and densities, in accordance with its relative height:



High aircraft relative altitude (feet)
Ref Alti -250/-500*
(Maximum Elevation NUMBER)
Highest Band
Low Density Yellow
Solid Green
Middle band
High Density Green
(Minimum Elevation Number)
Reference Altitude
Lowest band
Low Density Green
Black
Sea Level
Cyan
Low aircraft relative altitude (feet)
(Maximum Elevation NUMBER)
Ref Alti + 2000
High density red
Ref Alti + 1000
High density yellow
Low density yellow
Ref Alti - 250/- 500*
High density green
Ref Alti - 1000
(Minimum Elevation Number)
Low density green
Ref Alti - 2000
Reference Altitude
Black
Sea Level
Cyan
*: REFERENCE ALTITUDE - 250FT WITH GEAR DOWN.
REFERENCE ALTITUDE - 500FT WITH GEAR UP.

Note:
- *Areas without available terrain data in the EGPWS database appear in magenta*
- *The reference altitude is computed based on the current aircraft altitude or, if descending more than 1 000 ft/min, the altitude expected in 30 s*
- *In case of flight above the maximum elevation number, the relief between the minimum and maximum displayed elevations is displayed by using three different green levels.*

(2) Center Part Messages

- The “TERR CHANGE MODE” indication is displayed in red (or amber), in the case of a Terrain Awareness Display (TAD) warning (or caution) alert, if the current selected display mode is PLAN
- The “TERR REDUCE RANGE” indication is displayed in red (or amber), in the case of a Terrain Awareness Display (TAD) warning (or caution) alert, if the selected range is 160 NM or 320 NM.

(3) TERR indication
To differentiate between the terrain and the weather display, the weather radar TILT is replaced by a blue TERR, and the terrain display sweeps from the center outward to both ND sides.

(4) Warning and caution messages

TERRAIN or OBST (amber) : For a caution.

TERRAIN or OBST (red) : For a warning.

When triggered, these messages flash for 9 s, then remain steady until the caution or warning alert condition disappears.

TERR RNG (red) : For a RANGE error warning.

TERR TST (amber) : Appears during the EGPWS test, when the terrain pattern is displayed, and there is no failure.

(5) Terrain or obstacle caution alert
Generated when a conflict exists between the terrain caution envelope, ahead of the aircraft, and database-stored terrain/obstacles. The conflict area is shown in solid yellow.

(6) Terrain or obstacle warning alert
Generated when a conflict exists between the terrain warning envelope, ahead of the aircraft, and terrain/obstacles data stored in the database. The conflict area is shown in solid red.

Note: *When an alert is generated (either caution or warning) and TERR ON ND is not selected, the terrain is automatically displayed and the TERR ON ND’s pushbutton ON light comes on.*

(7) Lowest and highest elevations

Minimum and maximum elevations encountered ahead of the aircraft, within the selected ND range. The color code of the elevation figures is the same as for the EGPWS terrain picture.

*: REFERENCE ALTITUDE - 250FT WITH GEAR DOWN.
REFERENCE ALTITUDE - 500FT WITH GEAR UP.

Note:
- *Areas without available terrain data in the EGPWS database appear in magenta*
- *The reference altitude is computed based on the current aircraft altitude or, if descending more than 1 000 ft/min, the altitude expected in 30 s*
- *In case of flight above the maximum elevation number, the relief between the minimum and maximum displayed elevations is displayed by using three different green levels.*

(2) Center Part Messages

- The “TERR CHANGE MODE” indication is displayed in red (or amber), in the case of a Terrain Awareness Display (TAD) warning (or caution) alert, if the current selected display mode is PLAN
- The “TERR REDUCE RANGE” indication is displayed in red (or amber), in the case of a Terrain Awareness Display (TAD) warning (or caution) alert, if the selected range is 160 NM or 320 NM.

(3) TERR indication

To differentiate between the terrain and the weather display, the weather radar TILT is replaced by a blue TERR, and the terrain display sweeps from the center outward to both ND sides.

(4) Warning and caution messages

TERR AHEAD (amber) : For a caution.

TERR AHEAD (red) : For a warning.

When triggered, these messages flash for 9 s, then remain steady until the caution or warning alert condition disappears.

TERR RNG (red) : For a RANGE error warning.

TERR TST (amber) : Appears during the EGPWS test, when the terrain pattern is displayed, and there is no failure.

(5) Terrain caution alert

Generated when a conflict exists between the terrain caution envelope, ahead of the aircraft, and the terrain data stored in the database. The conflict area is shown in solid yellow.

(6) Terrain warning alert

Generated when a conflict exists between the terrain warning envelope, ahead of the aircraft, and the terrain data stored in the database. The conflict area is shown in solid red.

Note: *When an alert is generated (either caution or warning) and TERR ON ND is not selected, the terrain is automatically displayed and the TERR ON ND’s pushbutton ON light comes on.*

(7) Lowest and highest elevations

Minimum and maximum elevations encountered ahead of the aircraft, within the selected ND range. The color code of the elevation figures is the same as for the EGPWS terrain picture.

Note: *The elevations shown on the ND correspond to the terrain included in the selected ND range, ahead of the aircraft. In ARC mode, the elevations are linked with the terrain displayed on the ND. In ROSE mode, the elevations may not represent the lowest and highest terrain currently displayed on the ND.*

Medium density green
Ref Alti - 1000
(Minimum Elevation Number)
Low density green
Ref Alti - 2000
Reference Altitude
Black
Sea Level
Cyan

Note:
- *Areas without available terrain data in the GPWS database appear in magenta*
- *The reference altitude is computed based on the current aircraft altitude or, if descending more than 1 000 ft/min, the altitude expected in 30 s*
- *In case of flight above the maximum elevation number, the relief between the minimum and maximum displayed elevations is displayed by using three different green levels.*

(2) Center Part Messages

- The “TERR CHANGE MODE” indication is displayed in red (or amber), in the case of a predictive mode warning (or caution) alert, if the current selected display mode is PLAN
- The “TERR REDUCE RANGE” indication is displayed in red (or amber), in the case of a predictive mode warning (or caution) alert, if the selected range is 160 NM or 320 NM.

(3) TERR indication

To differentiate between the terrain and weather display, the weather radar TILT is replaced by a blue TERR, and the terrain display sweeps from the center outward to both ND sides.

(4) Warning and caution messages

TERR AHEAD or OBST AHEAD (amber)	:	For a caution.
TERR AHEAD or OBST AHEAD (red)	:	For a warning.

When triggered, these messages flash for 9 s, then remain steady until the caution or warning alert condition disappears.

TERR RNG (red)	:	For a RANGE error warning.
TERR TST (amber)	:	Appears during the GPWS test, when the terrain pattern is displayed, and there is no failure.

(5) Terrain or obstacle caution alert

Generated when a conflict exists between the terrain caution envelope, ahead of the aircraft, and database-stored terrain/obstacles. The conflict area is displayed in solid yellow.

(6) Terrain or obstacle warning alert

Generated when :
- A conflict exists between the terrain/obstacle warning envelope, ahead of the aircraft, and the terrain/obstacle data stored in the database
- The aircraft is able to climb over the terrain/obstacle.

The conflict area is displayed in solid red.

Note: *When an alert is generated (either caution or warning) and TERR ON ND is not selected, the terrain is automatically displayed and the TERR ON ND pushbutton ON light comes on.*

(7) Lowest and highest elevations
Minimum and maximum elevations encountered ahead of the aircraft, within the selected ND range. The color code of the elevation figures is the same as for the GPWS terrain picture.

Note: *The elevations shown on the ND (ROSE or ARC mode) correspond to the terrain (obstacles ◁) included in the selected ND range, ahead of the aircraft.*

(8) Avoid Terrain warning
The conflict area is indicated by a red and black crosshatched pattern.

Generated when :
- There is a conflict between the terrain warning envelope, ahead of the aircraft, and the terrain data stored in the database
- The aircraft is not able to climb over the terrain with sufficient safety margin.

Note: *When an alert is generated (either caution or warning) and TERR ON ND is not selected, the terrain is automatically displayed and the ON light on the TERR ON ND pushbutton comes on.*

CENTER PART MESSAGES

MODE CHANGE	Appears if there is a discrepancy between the selected mode on the EFIS control panel and the mode sent from the onside FMGC, or while the DMC is preparing a new page for display.
RANGE CHANGE	Appears if there is a discrepancy between the range selected on the EFIS control panel and the range sent from the onside FMGC. A MODE CHANGE message has priority over a RANGE CHANGE message.
MAP NOT AVAIL	Appears when one of the following occurs: • The MODE CHANGE or RANGE CHANGE message appears for more than 6 s, or • The FMGC has failed, or • The FMGC has delivered an invalid aircraft position.
W/S SET RNG 10 NM (PWS ◁)	Appears if a predictive windshear warning alert is triggered and the range is above 10 NM.
W/S SET RNG 10 NM (PWS ◁)	Appears if a predictive windshear caution alert is triggered and the range is above 10 NM.
W/S CHANGE MODE (PWS ◁)	Appears if a predictive windshear warning alert is triggered and the ND is not in ARC or ROSE mode.
W/S CHANGE MODE (PWS ◁)	Appears if a predictive windshear caution alert is triggered and the ND is not in ARC or ROSE mode.
TCAS ◁ Message	*Refer to DSC-34-SURV-60-20 TCAS Messages*

Ident.: DSC-31-45-B-00023984.0001001 / 28 MAY 20
Applicable to: ALL

VOR

In ROSE VOR mode, when the VOR bearing is not valid, this flag flashes for 9 s, then remains steady.

Ident.: DSC-31-45-B-00023989.0001001 / 28 MAY 20
Applicable to: ALL

OFFSET MESSAGE

OFST R(L) XX	Appears when the flight crew prepares an offset or if an offset is selected. The offset value is provided in NM.

Ident.: DSC-31-45-B-00023985.0001001 / 28 MAY 20
Applicable to: ALL

NAVIGATION RECEIVERS

VOR 1	Appears if the VOR 1(2) fails. The associated flag flashes for 9 s, then remains steady.
ADF 1	Appears if the ADF 1(2) fails. The associated flag flashes for 9 s, then remains steady.
DME 1	Appears if the DME 1(2) fails. The associated flag flashes for 9 s, then remains steady.

Ident.: DSC-31-45-B-00023987.0001001 / 28 MAY 20
Applicable to: ALL

COURSE AND SLOPE INDICATION

CRSXXX	Appears if the VOR/FLS /ILS course fails.
CRS---	Appears if there is non-computed data for the VOR/FLS /ILS course.
XX	Appears if the FLS slope is invalid.
--	Appears if there is non-computed data for the FLS slope.

14 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

DISCREPANCY MESSAGES

Refer to DSC-31-05-60 Side1/Side2 Discrepancy Messages.

Ident.: DSC-31-45-B-00023966.0001001 / 28 MAY 20
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

CHECK HDG

Both NDs display the CHECK HDG message if there is a discrepancy of at least 5 ° between the heading values.

Note: The CHECK HDG message flashes for a few seconds on the NDs, and then it remains steady. If the flight crew selects the PLAN mode on the NDs the CHECK HDG message does not appear.

Ident.: DSC-31-45-B-00023842.0001001 / 28 MAY 20
Applicable to: ALL

HDG

If the heading data fails, the ROSE, ARC and associated symbols disappear.
A HDG flag flashes for 9 s, then remains steady.

Ident.: DSC-31-45-B-00023983.0001001 / 28 MAY 20
Applicable to: ALL

G/S OR F-G/S (FLS ◁)

If G/S or F-G/S (FLS ◁) data fails, this flag flashes for 9 s, then remains steady.
If there is an inconsistency in the approach mode selection within one MMR, both G/S and F-G/S (FLS ◁) flags flash for 9 s, then remain steady.

Ident.: DSC-31-45-B-00023990.0001001 / 28 MAY 20
Applicable to: ALL

PRED W/S (PWS ◁)

Appears if the WINDSHEAR sw (PWS ◁) on the weather radar panel is set to AUTO, and a PWS ◁ fault is detected. This message appears on ground, or when flaps and slats are extended.
It is associated with a single chime. The radar image remains available, provided that the fault does not affect the radar mode.

Ident.: DSC-31-45-B-00023988.0002001 / 04 NOV 20
Applicable to: MSN 02887

OTHER MESSAGES

↓	Overflow arrow, displayed when more than one of the other messages are present at the same time.
BACK UP NAV ◁	Appears when the MCDU backup navigation mode is activated (*Refer to DSC-22_10-30 Back Up Navigation Mode*).
CHECK NORTH REF	Appears when the NORTH REF pb selection does not match the airport MAG/TRUE bearing reference (as stored in the FMGC navigation database), either at the departure airport (during preflight), or at the destination airport (when entering the ARRIVAL area).
GPS PRIMARY ◁	Appears when GPS PRIMARY mode is available, or has been recovered. The flight crew can clear this message by pressing the CLR key on the MCDU.
GPS PRIMARY LOST ◁	Appears when GPS PRIMARY is not available, and not clearable by flight crew action.
MAP PARTLY DISPLAYED	Appears when there is an incomplete data transmission between the FMGC and the DMC, or if the DMC cannot draw the complete MAP.

NAV ACCUR UPGRAD or NAV ACCUR DOWNGRAD	Appears when there is a change in navigation accuracy.
OFFSIDE FM CONTROL	Appears when the offside FMGC supplies the onside ND.
RTA MISSED ◁	Appears when a time constraint is defined in the active flight plan and this time constraint is predicted as "missed" by the FMGC.
SELECT TRUE REF	Appears when entering the polar area, if the TRUE North reference is not selected by the flight crew (MAG/TRUE pb).
SET OFFSIDE RNG/MODE	Appears in case of an FMGC 1(2) failure when the two ND ranges or modes selected on the EFIS control panels are different
SPECIFIC VOR/D UNAVAIL	Appears when the NAVAID, that is tuned for the selected approach or departure, is not available.
TCAS ◁ Operating Messages	*Refer to DSC-34-SURV-60-20 TCAS Messages*

Applicable to: ALL

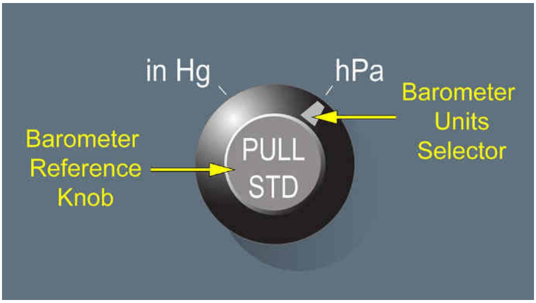
BAROMETER REFERENCE SELECTOR SCHEMATIC

The barometric reference controls have an outer selector, and an inner knob.



The flight crew uses the barometric reference selector to select the barometric unit hectoPascals (hPa) or inches of mercury (inHg).

L2 *Note: The PFDs do not display the selected barometric unit.*

Ident.: DSC-31-50-A-00024127.0002001 / 10 MAY 21
Applicable to: ALL

BAROMETER REFERENCE SELECTOR

The flight crew turns the barometric reference knob to select the QNH value.
The flight crew pulls or pushes the barometric reference knob to select the barometric reference (QNH or STD).
When the flight crew pulls the barometric reference knob, the barometric reference value is set to STD.

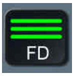
When the flight crew pushes the barometric reference knob, the barometric reference is set to QNH.

L2 The selected QNH value appears in the barometric reference window, and under the altitude scale on the PFD.

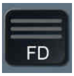
L1 At the EFIS CP power-up, the barometric reference is QNH and the QNH value is set to 1 013 hPa or 29.92 inHg, depending on the selected barometric unit.

Ident.: DSC-31-50-A-00024128.0001001 / 03 JUN 20
Applicable to: ALL

FD PB



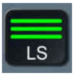
The CAPT(F/O) PFD displays the FD bars (or the FPD symbol if the TRK FPA reference is selected).



The CAPT(F/O) PFD does not display the FD bars (or the FPD symbol if the TRK FPA reference is selected).

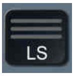
Ident.: DSC-31-50-A-00024143.0001001 / 12 MAY 22
Applicable to: ALL

LS PB



The CAPT(F/O) PFD displays the following landing system data in accordance with the approach selected on the ARRIVAL page (LS / GLS ◁ / FLS ◁ / SLS ◁): Deviation scales, deviation signals, course pointer, information.
For more information about the landing system data "*Refer to DSC-31-40 Trajectory Deviation - ILS Approach*".
If the flight crew selected an approach compatible with the FLS ◁ , the FMA displays the FLS ◁ capability, if the flight phase is descent or approach.
The FLS ◁ capability does not appear, if the NO FLS FOR THIS APPR message appeared on the MCDU.

Note: If the direct distance to the destination airport is more than 300 NM only the deviation scales appear.

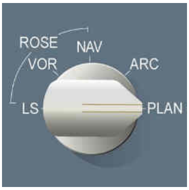


The CAPT(F/O) PFD does not display the landing system data.

Ident.: DSC-31-50-A-00024141.0001001 / 03 JUN 20
Applicable to: ALL

MODE SELECT SWITCH

L12

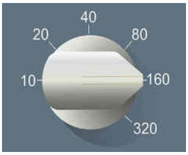


For navigation purposes, the flight crew can select one of the following display modes:

- PLAN mode, *Refer to DSC-31-45 Plan Mode*
  If the flight crew selects the PLAN mode, the ND does not display terrain, weather, or traffic information.
- ARC mode
  For more information, *Refer to DSC-31-45 ROSE NAV Mode/ARC Mode*
- ROSE-NAV mode
  For more information, *Refer to DSC-31-45 ROSE NAV Mode/ARC Mode*
- ROSE-VOR mode
  For more information, *Refer to DSC-31-45 ROSE VOR Mode*
- ROSE-LS mode
  For more information, *Refer to DSC-31-45 ROSE LS Mode*.

Ident.: DSC-31-50-A-00024131.0001001 / 03 JUN 20
Applicable to: ALL

RANGE SELECT SWITCH



The range selector enables the flight crew to select the range of the ND.

Note: *If the mode or the range data fails, the default selection is the ROSE NAV mode and 80 NM range.*

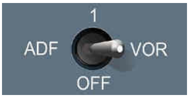
Enables the flight crew to select ADF1(2) ◁ on the onside ND, as well as the corresponding navaid data characteristics in any mode except PLAN mode.

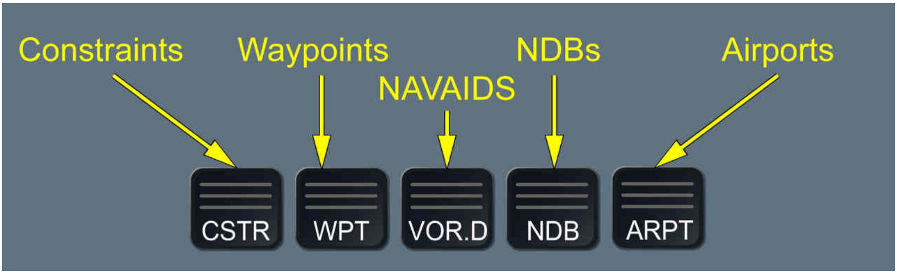


Enables the flight crew to select VOR1(2) bearing pointers and DME distance on the onside ND, as well as the corresponding navaid data characteristics in any mode except PLAN mode.

Ident.: DSC-31-50-A-00024133.0001001 / 03 JUN 20
Applicable to: ALL

OPTIONAL DATA DISPLAY PUSHBUTTON SCHEMATICS

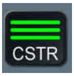
The flight crew can use the following pushbuttons to display the associated optional data in addition to the data permanently displayed in PLAN, ARC, or ROSE NAV modes. Only one option can be activated at a time.



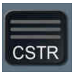
Ident.: DSC-31-50-A-00024134.0001001 / 03 JUN 20
Applicable to: ALL

OPTIONAL DATA DISPLAY PUSHBUTTON

CONSTRAINTS

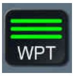


The ND displays constraints related to the waypoints.

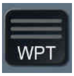


The ND does not display constraints.

WAYPOINTS

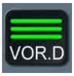


The ND displays the waypoints stored in the navigation database and the pilot stored navaids.
The flight crew can only select one display at a time (WPT, VOR-D, or NBD (ADF1(2) ⊲✳).

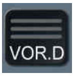


The ND does not display waypoints.

NAVAIDS

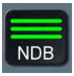


The ND displays the VORs and DMEs stored in the navigation database and the pilot stored navaids.
The flight crew can only select one display at a time (WPT, VOR-D, or NBD (ADF1(2) ◁✳).

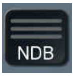


The ND does not display VORs and DMEs.

NDBS

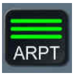


The ND displays the NDBs stored in the navigation database.
The flight crew can only select one display at a time (WPT, VOR-D, or NBD (ADF1(2) ◁✳).

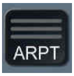


The ND does not display NDBs.

AIRPORTS



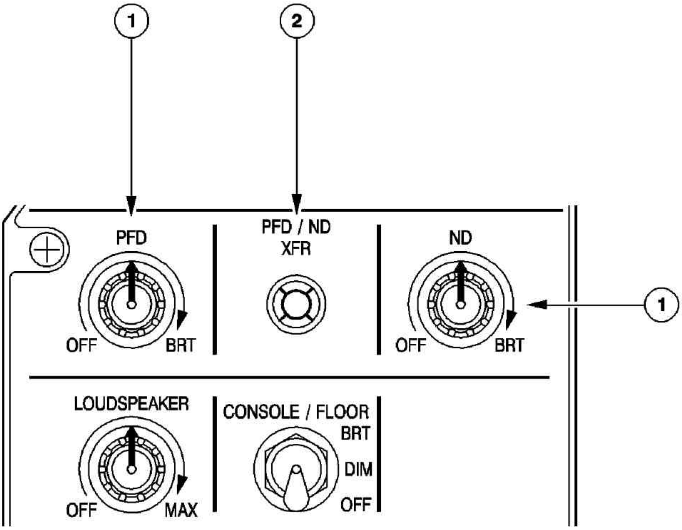
The ND displays the airports stored in the navigation database, other than the origin or destination airports.



The ND does not display airports.

OTHER EFIS CONTROLS

Ident.: DSC-31-50-00001258.0002001 / 15 FEB 11
Applicable to: ALL



(1) OFF/BRT knobs

- These knobs turn the PFD and ND display units on and off, and control their brightness.
- The display brightness adjusts automatically for changing light conditions, and is also adjusted manually.

PFD Brightness Control Knob
Rotating this knob all the way counterclockwise switches off the PFD. In this case, the PFD image is automatically displayed on the NDU, but the pilot may recover the ND by means of the PFD-ND XFR pushbutton .
ND Brightness Control Knob
The outer knob controls the brightness of both the weather radar image and EGPWS terrain display.
The inner knob controls the general brightness of the ND symbols.
Rotating this knob all the way counterclockwise switches off the NDU.

(2) PFD/ND Pushbutton
Pushing this button interchanges the PFD and the ND.

If the PFDU fails, the PFD automatically transfers to the NDU.

CHRONOMETER

(1) CHRONO Pushbutton
Pushing this button displays chronometer time on the onside ND.
Pushing it again freezes the displayed value.
Pushing it a third time resets the chronometer, and the chronometer time disappears from the display.

GENERAL

Ident.: DSC-31-55-10-00001260.0001001 / 21 MAR 16
Applicable to: MSN 01459

A fully independent clock is on the right side of the control panel.
It sends time to the centralized fault data interface unit, the flight data interface unit, and the flight management and guidance computer.
The clock has two electrical supplies, one of which is a direct connection to the aircraft battery hot bus.
The clock also has an internal battery that allows it to memorize time (for up to 50 h) if the aircraft battery is removed.

The clock performs four functions :
- It displays “UTC” (GMT) time in hours and minutes on the center counter.
- It displays elapsed time (ET) (from engine startup) in hours and minutes on the lower counter.
- It drives the chronometer (CHR), which measures a time interval (from the pushing of the CHRONO button) in minutes and seconds and displays it with a needle and in numbers on the upper counter.
- It can replace the UTC with the date.

(1) UTC (GMT) counter
This counter displays the present time in 24 h format.

A trend indicator, which divides a minute into four 15 s periods, uses three horizontal marks :

From 0 to 14 s	No mark is lighted.
From 15 to 29 s	The highest mark is lighted.
From 30 to 44 s	The two highest marks are lighted.
From 45 to 59 s	All the three marks are lighted.

(2) Elapsed Time (ET) and chrono counter (CHR)
This counter registers the elapsed time up to 99 h and 59 min.

(3) CHR needle
This needle ticks off chronograph seconds.
It is controlled by the CHR pushbutton.

(4) CHR pushbutton

First push : starts the second needle and the ET/CHR minute display.

Second push : stops the second needle and sums up the minutes in the ET/CHR display.

Third push : resets the second needle to zero and erases the ET/CHR display.

(5) UTC (GMT) selector

«RUN»	**STARTS THE UTCCOUNTER**	
	TIME MODE	**DATE MODE**[(1)]
«HLDY»	STOPS UTC COUNTER	TO ADVANCE YEARS FOR SETTING
«MSM»	TO ADVANCE MINUTES FOR SETTING	TO ADVANCE MONTHS FOR SETTING
«HSD»	TO ADVANCE HOURS FOR SETTING	TO ADVANCE DAYS FOR SETTING

(1) *Press the date pushbutton to switch the clock to date mode.*

(6) DATE pushbutton

First push : sets the clock to date mode. The date (day, month, year) replaces the UTC time display.

Second push : sets the clock to time mode. The date display disappears.

Note: in order to select the date mode, the UTC selector must be set to RUN.

(7) ET (elapsed time) selector

"RUN" position : starts the ET counter.

"HLD" position : stops the counter, keeps the display at its last indication.

"RESET" position : resets counter to zero (transient position).

UTC (GMT) COUNTER

This counter displays the present time in 24 h format from 0 to 23 h 59 min 59 s.

ELAPSED TIME (ET)

This counter registers the elapsed time up to 99 h and 59 min.

CHRONO (CHR) COUNTER

This counter registers elapsed time from 0 to 99 min 59 s. It is controlled by the CHR pushbutton.

CHR PUSHBUTTON

First push	:	starts the CHR counter
Second push	:	stops the CHR counter, keeps the display at its last indication.

RESET (RST) PUSHBUTTON

When pressed, the CHR counter restarts from 0 provided that the chrono has been first stopped with the CHR pushbutton.

ET SELECTOR

"RUN"	:	the ET counter starts
"STP"	:	the ET counter stops counting
spring loaded "RST"	:	the ET counter is blanked. The selector returns to its STP position when the selector is released.

Note: *A cumulative elapsed time can be realized by alternatively setting this switch in "RUN" and "STP" position.*

DATE/SET PUSHBUTTON

First push	:	sets the clock to date mode. The UTC time display is replaced by the date (day month year).
Second push	:	sets the clock to time mode. The date display disappears.

Note: *in order to select the date mode, the UTC selector must be set on "GPS" or "INT" position.*

UTC SELECTOR

"GPS" : Time (or date, if selected) is displayed, and this data is synchronized on GPS information.

Note:
- *If the signal between the GPS and the clock is not detected, dashes are displayed. Only the "INT" and "SET" positions are then available.*
- *If the signal is detected, but GPS data is invalid, the clock automatically runs on its internal time.*
- *The clock will automatically resynchronize on the GPS information, as soon as the GPS data becomes available.*

"INT" : Internal time (or date, if selected) is displayed.

Note:
- *The clock's internal time is initialized with the latest valid GPS information.*
- *If there is no valid GPS information at power up, the internal time will be 00:00:00, until the clock is initialized.*

"SET" : Allows the internal time and date to be initialized.

OPERATION IN INTERNAL MODE

Ident.: DSC-31-55-20-00007126.0001001 / 21 MAR 17

2 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

DATE INITIALIZATION

Set the UTC selector on “SET”. The minute digits flash, and the seconds’ digits are blank.
To increase data, turn the DATE/SET button clockwise.
To decrease data, turn the DATE/SET button counterclockwise.

- First, push on DATE/SET : To set the hour.
- Second, push on DATE/SET : To set the year.
- Third, push on DATE/SET : To set the month.
- Fourth, push on DATE/SET : To set the day.

Switch the UTC selector to the “INT” position, and the clock starts with the seconds’ digits at 00.

Note: *This process must be completed in less than one minute. Otherwise, it will be necessary to reset the CFDS in order to synchronize the lower ECAM time display with the cockpit clock display. Resetting the CFDS is a maintenance operation.*

PRECAUTION IN CASE OF ATC DATALINK COMMUNICATION

If the clock is set to internal (INT) mode and the flight crew manually sets the time and date, the clock does not comply with the time precision required for ATC datalink communication (+/-1 s UTC). This may lead to the rejection of messages, or to the acceptance of obsolete messages:

- The CPDLC function will send CPDLC messages with an erroneous date/time
- The CPDLC function will accept obsolete uplink messages and may reject uplink messages with a correct date/time
- The uplink messages for oceanic and departure clearance will be displayed in the Datalink Control and Display Unit (DCDU) with an erroneous time
- The ADS-C function will continue to operate, but in a degraded mode.

To comply with the time precision requirement for ATC datalink communication, the flight crew must either:

- Use the clock in GPS mode, or
- Use the clock in INT mode and synchronize the clock with the GPS at least one time per day. This synchronization ensures that the UTC time drift is below +/- 1 s UTC.

GPS SYNCHRONIZATION IN INTERNAL MODE

When the clock is set to INT mode, the UTC time is only based on the internal clock and is not synchronized with the GPS. To reset the drift that results from the UTC internal time, the flight crew must perform the following actions:

- Set the UTC selector of the clock to the GPS mode and keep this setting during at least 10 seconds
- Then reset the UTC selector of the clock to INT mode.

These actions result in a resynchronization of the internal clock with the GPS.

UPDATING DAY, MONTH AND YEAR

Ident.: DSC-31-55-20-00007135.0001001 / 21 MAR 16
Applicable to: MSN 01459

Press the DATE pushbutton to set the date mode. The day, month and year appear.

- To advance the day, turn and maintain the UTC selector at the MSD position until the proper day appears.
- For month and year proceed in the same way, using MSM to advance month or HLDY to advance years.

Note: *To return to normal functioning, switch the UTCselector to RUN position.*

UPDATING OF HOUR AND MINUTE

Ident.: DSC-31-55-20-00007136.0001001 / 21 MAR 16
Applicable to: MSN 01459

Use the same procedure in time mode for changing hour and minute. To advance the minute turn the UTC selector to MSM and to HSD for the hour.

Note: *To return to normal functioning, switch the UTC selector to RUN position.*

DESCRIPTION

Ident.: DSC-31-60-10-00001262.0003001 / 05 NOV 20

Applicable to: MSN 10949-11597

The FDR function, which records the mandatory parameters, is integrated in two identical CVDR units.

The two CVDRs are combined CVR-FDR crashproof equipment gathering the following functions:
- Cockpit Voice Recorder function
- Flight Data Recorder function
- Data Link Recorder function
- Underwater Locator Beacon.

The CVDRs can store the last 25 h data.

The CVDRs are connected to the FDIMU, installed in the avionic bay, which provides the recorders with:
- Flight parameters
- Data from the accelerometers (acceleration of the aircraft along each of the three axes)
- Time information.

The recording system is automatically active:
- On ground during the first 5 min after the aircraft electrical network is energized
- On ground with one engine running
- In flight.

The recording system stops automatically 5 min after the last engine shutdown.
On ground, personnel can start the recording system manually by pressing the GND CTL pb-sw.
The QAR ◁ is an operational recorder that stores the same data as the FDR function with an easier access for maintenance.

DESCRIPTION

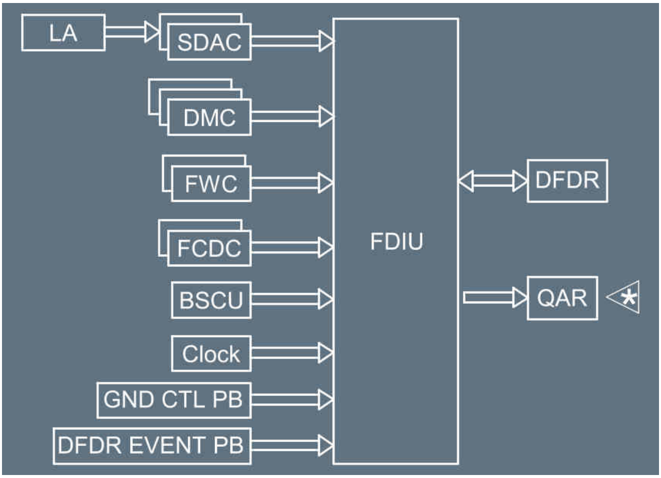
Ident.: DSC-31-60-10-00001262.0001001 / 09 OCT 12

Applicable to: MSN 01143-01518, 01593-01628

The Flight Data Recording System, which records the mandatory parameters, consists of the following components:
- A Flight Data Interface Unit (FDIU)
- A Digital Flight Data Recorder (DFDR)
- A three-axis Linear Accelerometer (LA)

The FDIU collects and processes parameters from the SDACs, DMCs, FWCs, FCDCs, BSCU, the DFDR event pushbutton, the GND CTL pushbutton and the Clock.
It stores the mandatory flight parameters in the DFDR.

The DFDR can store the last 25 h data, at least. It stores this data on a fireproof and shockproof device. An underwater locator beacon is attached to the DFDR.
The linear accelerometer measures the acceleration of the aircraft along each of the three axes.
The QAR is an operational recorder that stores the same data as the DFDR. However the QAR is more accessible for the maintenance crew.



The recording system is automatically active:
- On the ground, during the first five minutes after the aircraft electric network is energized.
- On the ground, after the first engine start.
- In flight (whether the engines are running or not).

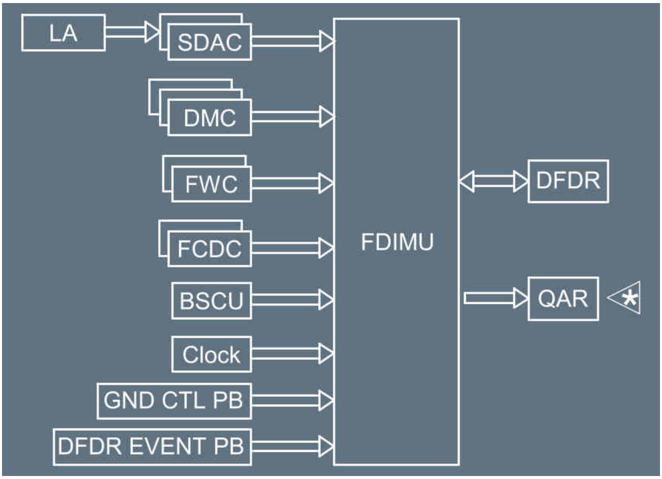
On the ground, the recording system stops automatically five minutes after the second engine shuts down.
On the ground, the crew can start the recording system manually by pressing the GND CTL pushbutton.

DESCRIPTION

Ident.: DSC-31-60-10-00001262.0002001 / 09 OCT 12
Applicable to: MSN 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324

The Flight Data Recording System, which records the mandatory parameters, consists of the following components:
- A Flight Data Interface and Management Unit (FDIMU)
- A Digital Flight Data Recorder (DFDR)
- A three-axis Linear Accelerometer (LA)

The FDIMU collects and processes parameters from the SDACs, DMCs, FWCs, FCDCs, BSCU, the DFDR event pushbutton, the GND CTL pushbutton and the Clock.
It stores the mandatory flight parameters in the DFDR.
The DFDR can store the last 25 h data, at least. It stores this data on a fireproof and shockproof device. An underwater locator beacon is attached to the DFDR.
The linear accelerometer measures the acceleration of the aircraft along each of the three axes.
The QAR is an operational recorder that stores the same data as the DFDR. However the QAR is more accessible for the maintenance crew.



The recording system is automatically active:
- On the ground, during the first five minutes after the aircraft electric network is energized.
- On the ground, after the first engine start.
- In flight (whether the engines are running or not).

On the ground, the recording system stops automatically five minutes after the second engine shuts down.
On the ground, the crew can start the recording system manually by pressing the GND CTL pushbutton.

Applicable to: MSN 01143-01518, 01593-01628

The AIDS is used to monitor various aircraft system parameters in order to make maintenance easier and to allow formulating operational recommendations.
The AIDS can generate system reports. The Airbus Standard Reports are preprogrammed reports available at aircraft delivery. The operator can create its own reports.
The AIDS consists of a Data Managements Unit (DMU) connected as shown below.
The system may be programmed using the MCDUs. The crew can select any report to be displayed on the MCDUs.
The Printer prints the flight phase programmed reports or any report selected on the MCDU.
This printing may be automatic or in response to the AIDS PRINT pushbutton.
The AIDS may send automatic reports via ACARS ◁ .
An optional Digital Recorder may be installed to extend the recording capacity.

GENERAL

Ident.: DSC-32-10-10-00018598.0001001 / 21 MAR 16
Applicable to: ALL

The landing gear consists of :
- Two main landing gears that retract inboard
- One nose landing gear that retracts forward.

Doors enclose the landing gear bays. Gear and doors are electrically controlled and hydraulically operated.
The doors, which are fitted to the landing gear struts, are operated mechanically by the gear and close at the end of gear retraction.
All gear doors open while the gear is retracting or extending.
Two Landing Gear Control and Interface Units (LGCIUs) control the extension and retraction of the gear and the operation of the doors. They also supply information about the landing gear to ECAM for display, and send signals indicating whether the aircraft is in flight or on the ground to other aircraft systems.
A hand crank on the center pedestal allows the flight crew to extend the landing gear if the aircraft loses hydraulic systems or electrical power.

MAIN LANDING GEAR (MLG)

Ident.: DSC-32-10-10-00018599.0001001 / 21 MAR 16
Applicable to: ALL

Each main gear has twin wheels and an oleopneumatic shock absorber.
Each main wheel has an antiskid brake.

NOSE LANDING GEAR (NLG)

Ident.: DSC-32-10-10-00018600.0001001 / 21 MAR 16
Applicable to: ALL

The two-wheeled nose gear has an oleopneumatic shock strut and a nose wheel steering system.

NORMAL OPERATION

The flight crew normally operates the landing gear by means of the lever on the center instrument panel.
The LGCIUs control the sequencing of gear and doors electrically. One LGCIU controls one complete gear cycle, then switches over automatically to the other LGCIU at the completion of the retraction cycle. It also switches over in case of failure.
The green hydraulic system actuates all gear and doors. When the aircraft is flying faster than 260 kt, a safety valve automatically cuts off hydraulic supply to the landing gear system. Below 260 kt, the hydraulic supply remains cut off as long as the landing gear lever is up.

LANDING GEAR GRAVITY EXTENSION

If the normal system fails to extend the landing gear hydraulically, the flight crew can use a crank to extend it mechanically.

When a crew member turns the crank, it :
- Isolates the landing gear hydraulics from the green hydraulic system
- Unlocks the landing gear doors and the main and nose main gear
- Allows gravity to drop the gear into the extended position.

Locking springs help the crew to crank the main gear into the locked condition, and aerodynamic forces assist in the locking of the nose gear.

The gear doors remain open.
The flight crew can reset the emergency extension system in flight after using it for training (if green hydraulic pressure is available).

Intentionally left blank

LANDING GEAR CONTROL INTERFACE UNIT (LGCIU)

Applicable to: ALL

Ident.: DSC-32-10-20-A-00018604.0001001 / 21 MAR 16

GENERAL

The LGCIUs receive position information from the landing gear, cargo door, and landing flap systems.

Ident.: DSC-32-10-20-A-00018605.0001001 / 21 MAR 16

LANDING GEAR INFORMATION

The LGCIUs receive landing gear position information from proximity detectors when:
- The landing gears are locked down or up, or
- The shock absorbers are compressed or extended, or
- The landing gear doors are open, or closed, or
- The bogie are aligned or not.

The LGCIUs send the landing gear position data to other aircraft systems.
In case of a LGCIU failure, the landing gear is controlled by the remaining healthy LGCIU.

Ident.: DSC-32-10-20-A-00018606.0001001 / 17 MAY 21

CARGO DOORS INFORMATION

Sensors send to the LGCIUs the position of the following components :
- Manual selector valves
- Locking shaft
- Locking handle
- Safety shaft
- Door sills ⊲ .

The LGCIUs detect electrical failures only in certain proximity switches in the cargo door system :
- Locking shaft
- Locking handle
- Safety shaft.

When an LGCIU makes such a detection, it indicates the NON LOCKED condition for that component.

Ident.: DSC-32-10-20-A-00018607.0001001 / 21 MAR 16

LANDING FLAPS INFORMATION

The LGCIUs process the signals from four flap disconnect proximity switches, then send them to the Slat/Flap Control Computers (SFCCs).
The LGCIUs do not monitor failures in the SFCC system.

GENERAL

Ident.: DSC-32-10-30-00001285.0001001 / 10 DEC 09
Applicable to: ALL

The following tables present the operational effects of the proximity detectors on aircraft systems.
How to read the tables :

SYSTEM	LGCIU 1	LGCIU 2	A/C IN FLT	A/C ON GROUND
SERVICE INTERPHONE	**6**	**6**	....	....
SFCC 1(2)	**5**	**(5)**	....	....

The above lines mean that the service interphone receives the output n° 6 from both LGCIUs, while SFCC 1 receive the output 5 from LGCIU 1 and SFCC 2 the output 5 from LGCIU 2.
The two additional columns give the system functioning when the aircraft is in flight and on the ground.

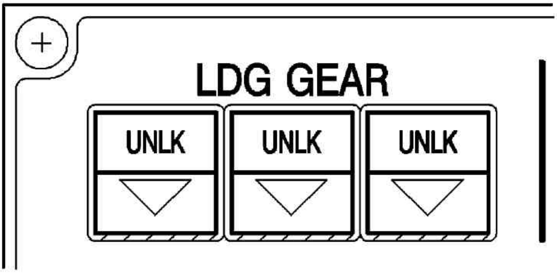
LANDING GEAR INDICATOR PANEL

Ident.: DSC-32-10-40-00018615.0001001 / 21 MAR 16
Applicable to: ALL



This panel is connected to LGCIU1, which receives signals from proximity detectors.

▿ light:	comes on green if the gear is locked down.
UNLK: light	comes on red if the gear is not locked in the selected position.

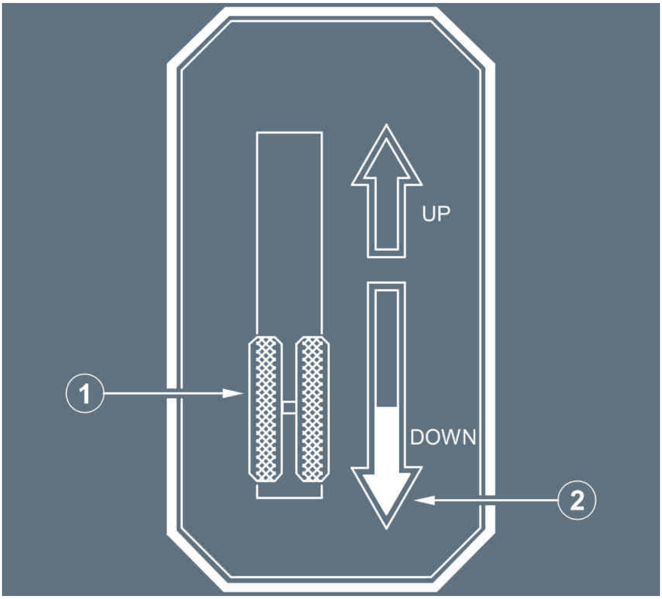
Note: *This panel is connected to the LGCIU1 only, therefore, the lights on the LDG GEAR indicator panel come on as long as the LGCIU1 is electrically supplied.*
If one UNLK indication remains on, the landing gear position can be confirmed using the WHEEL SD page (information from LGCIU 1 & 2). Only one green triangle on each landing gear is sufficient to confirm that the landing gear is downlocked.

LANDING GEAR SELECTOR LEVER

Ident.: DSC-32-10-40-00018616.0001001 / 20 MAY 16
Applicable to: ALL

A two-position selector lever sends electrical signals to the two LGCIUs. These control the green hydraulic supply to the landing gear system by means of selector valves.
The flight crew must always move the L/G lever in one continuous movement (i.e. with no stop between both positions).

When the flight crew selects UP or DOWN (and if the airspeed is below 260 kt):
- All landing gear doors open
- Each landing gear moves to the selected position
- All landing gear doors close.



(1) L/G LEVER

UP : This position selects landing gear retraction.
While the landing gear doors are opening, the normal brake system brakes the wheels of the main landing gear automatically.
A brake band in the nose landing gear well brakes the nose landing gear wheels as the doors close (for aircraft equipped with nose landing gear rubbing strips).

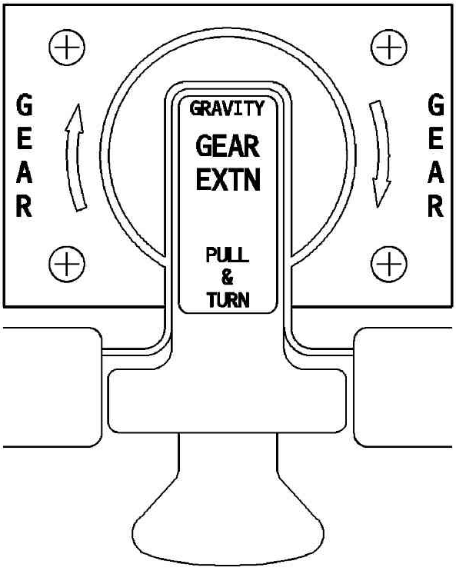
DOWN : This position selects landing gear extension.
An interlock mechanism prevents anyone from accidentally retracting the gear while the aircraft is on the ground. It does so by locking the lever in DOWN position when the shock absorber on either main gear is compressed (aircraft on ground) or the nose wheel steering is not centered.
The landing gear hydraulic system remains pressurized as long as the landing gear is extended (if green hydraulic pressure is available).

(2) RED ARROW

This red arrow lights up if the landing gear is not locked down when the aircraft is in the landing configuration, and a red warning appears on ECAM.

LANDING GEAR GRAVITY EXTENSION

Ident.: DSC-32-10-40-00018617.0001001 / 21 MAR 16
Applicable to: ALL



To put the landing gear down by gravity, the flight crew must pull the gear crank out, then turn it clockwise for 3 turns.
When the flight crew operates the crank handle, the cutout valve shuts off hydraulic pressure to the landing gear system and depressurizes it.

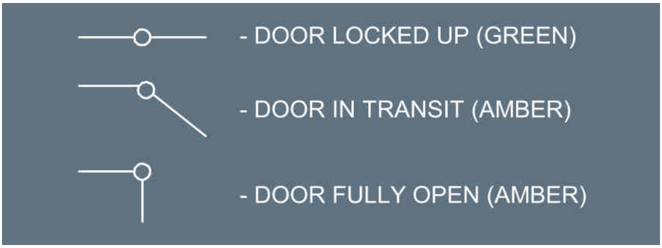
(1) Landing gear position indication

The landing gear positions are indicated by 2 triangles for each gear. The indications are as follow:

- Green triangle indicates that one LGCIU detects a landing gear downlocked
- Red triangle indicates that one LGCIU detects a landing gear in transit
- No triangle indicates that one LGCIU detects a landing gear uplocked
- Amber crosses will replace the right triangle to indicate that LGCIU 1 or LGCIU 2 has failed.

Note: *Only one green triangle on each landing gear strut is sufficient to confirm that the landing gear is downlocked.*

(2) Landing gear door position indication



- DOOR LOCKED UP (GREEN)
- DOOR IN TRANSIT (AMBER)
- DOOR FULLY OPEN (AMBER)

(3) UP LOCK

This legend appears amber along with a caution on the ECAM if the landing gear uplock is engaged when the landing gear is down locked.

(4) L/G CTL

This legend appears amber along with an ECAM caution if the landing gear lever and the landing gear position do not agree. This legend only appears when the landing gear is moving to the selected position.

DESCRIPTION

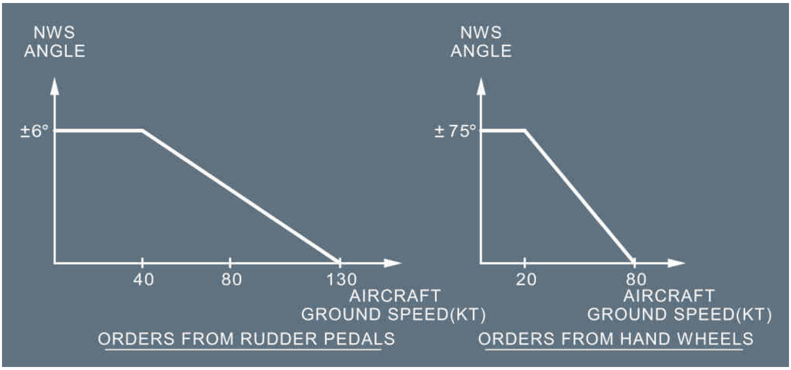
Ident.: DSC-32-20-10-00018619.0007001 / 28 FEB 18

1 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

A hydraulic actuating cylinder steers the nose wheel. The yellow hydraulic system supplies pressure to the cylinder, and electric signals from the Brake and Steering Control Unit (BSCU) control it.

The BSCU receives orders from:
- Captain's, and the First Officer’s steering hand wheels (orders added algebraically), or
- Rudder pedals, or
- Autopilot.

The BSCU transforms these orders into nose wheel steering angle. That angle has the following limits, which depend on ground speed and the origin of the orders.



The steering system receives actuating hydraulic pressure when:
- A/SKID & N/W STRG switch is ON
- Towing control lever is in normal position
- At least one engine is running
- Aircraft is on ground.

The handwheel can turn the nosewheel up to 75 ° in either direction. A lever, on the towing electrical box (on nose landing gear), enables ground crew to deactivate the steering system for towing. Then the wheel can be turned 95 ° in either direction.
To prevent rudder pedal orders, or autopilot orders, from going to the BSCU, the pilots can use the pushbutton on either steering handwheel.
An internal cam mechanism returns the nose wheel to the centered position after takeoff.

DESCRIPTION

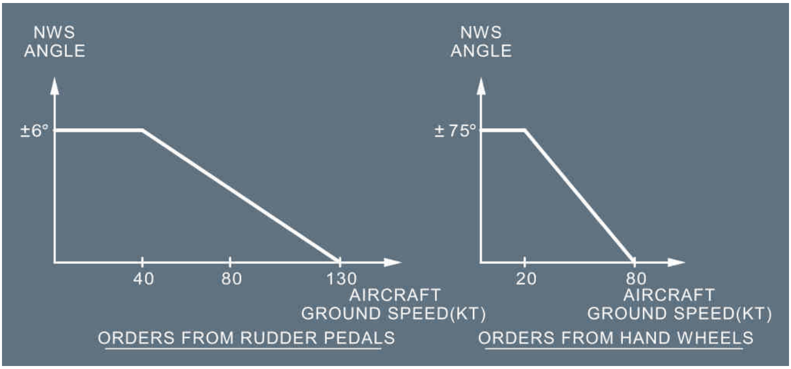
Ident.: DSC-32-20-10-00018619.0002001 / 21 MAR 16

Applicable to: MSN 02321

A hydraulic actuating cylinder steers the nose wheel. The green hydraulic system supplies pressure to the cylinder, and electric signals from the Brake and Steering Control Unit (BSCU) control it.

The BSCU receives orders from:
- Captain's, and the First Officer’s steering hand wheels (orders added algebraically), or
- Rudder pedals, or
- Autopilot.

The BSCU transforms these orders into nose wheel steering angle. That angle has the following limits, which depend on ground speed and the origin of the orders.



The steering system receives actuating hydraulic pressure when:
- A/SKID & N/W STRG switch is ON
- Towing control lever is in normal position
- At least one engine is running
- Aircraft is on ground.

The nose landing gear doors must be closed in order for the green hydraulic system to apply pressure to the actuating cylinder.
The handwheel can turn the nose wheel up to 75 ° in either direction. A lever on the towing electrical box (on nose landing gear) allows ground crew to deactivate the steering system for towing. This then allows the wheel to be turned 95 ° in either direction.
The pilots can use a pushbutton on either steering handwheel to prevent rudder pedal orders or autopilot orders from going to the BSCU.
An internal cam mechanism returns the nose wheel to the centered position after takeoff.

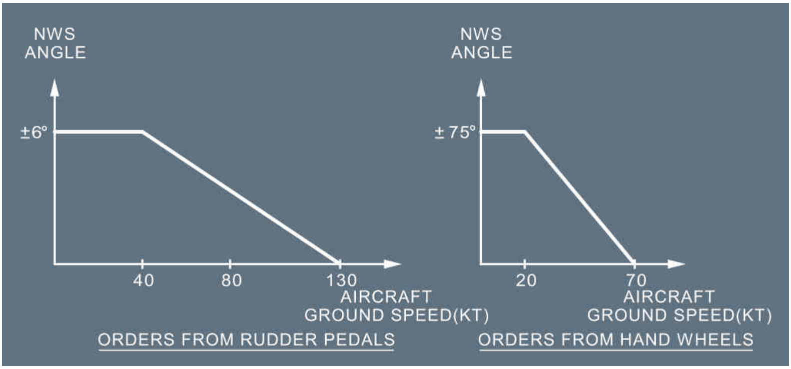
DESCRIPTION

Ident.: DSC-32-20-10-00018619.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014

A hydraulic actuating cylinder steers the nose wheel. The green hydraulic system supplies pressure to the cylinder, and electric signals from the Brake and Steering Control Unit (BSCU) control it.

The BSCU receives orders from:
- Captain's, and the First Officer’s steering hand wheels (orders added algebraically), or
- Rudder pedals, or
- Autopilot.

The BSCU transforms these orders into nose wheel steering angle. That angle has the following limits, which depend on ground speed and the origin of the orders.



The steering system receives actuating hydraulic pressure when:
- A/SKID & N/W STRG switch is ON
- Towing control lever is in normal position
- At least one engine is running
- Aircraft is on ground.

The nose landing gear doors must be closed in order for the green hydraulic system to apply pressure to the actuating cylinder.
The handwheel can turn the nose wheel up to 75 ° in either direction. A lever on the towing electrical box (on nose landing gear) allows ground crew to deactivate the steering system for towing. This then allows the wheel to be turned 95 ° in either direction.
The pilots can use a pushbutton on either steering handwheel to prevent rudder pedal orders or autopilot orders from going to the BSCU.
An internal cam mechanism returns the nose wheel to the centered position after takeoff.

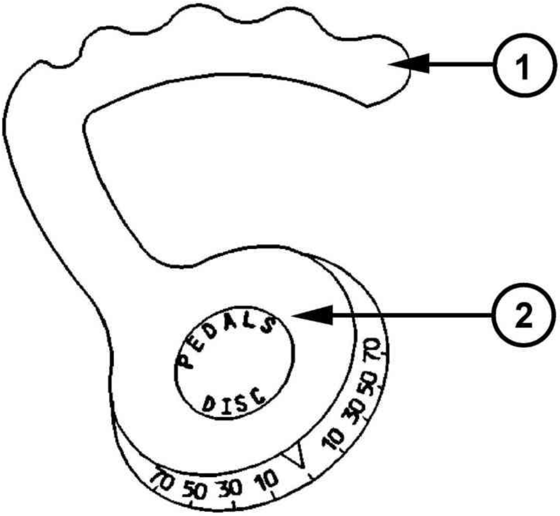
Applicable to: ALL



(1) Steering handwheels
The steering handwheels, which are interconnected, can steer the nose wheel up to 75 ° in either direction.

Note: The steering system centers the nose wheel automatically after liftoff.

(2) Rudder PEDALS DISC pb
Pressing this button on either handwheel removes control of nose wheel steering from the rudder pedals until the button is released.

MEMO DISPLAY

Ident.: DSC-32-20-20-00016853.0001001 / 04 JUN 19
Applicable to: ALL

NW STRG DISC : This memo appears, when the nose wheel steering selector is in the towing position and with engines not running.

NW STRG DISC : This memo appears, when the nose wheel steering selector is in the towing position and if at least one engine is running.

Intentionally left blank

GENERAL

Ident.: DSC-32-30-10-00018623.0002001 / 21 MAR 16
Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597

The main wheels are equipped with carbon multidisc brakes, which can be actuated by either of two independent brake systems.
The normal system uses green hydraulic pressure, whereas the alternate system uses the yellow hydraulic system backed up by the hydraulic accumulator.
An anti-skid and autobrake system is also provided.
Braking commands come from either the brake pedals (pilot action), or the autobrake system (deceleration rate selected by the crew).
In normal operation, a dual channel Brake and Steering Control Unit (BSCU) controls normal braking and antiskid.

Depending on the failure, braking may revert to:
- Alternate braking with antiskid. This braking mode is controlled by the Alternate Braking Control Unit (ABCU), and the antiskid is controlled by the BSCU
- Alternate braking without antiskid. This braking mode is fully-controlled by the ABCU
- Alternate braking without antiskid on accumulator. This braking mode is fully-controlled by the ABCU.

All the normal and alternate braking components are fully-monitored. Any detected failure is signaled to the crew via ECAM warnings.

The BSCU performs the following secondary functions:
- Checks the residual pressure in the brakes
- Monitors the brake temperature
- Provides discrete wheel speed information to other aircraft systems.

A changeover between the two BSCU channels takes place at each DOWN landing gear lever selection, or in case one channel fails.
The main gear wheels are fitted with fusible plugs which protect against tire burst, in the event of overheat.
Main gear wheels are also equipped with brake cooling fans ◁ , which permit a high speed cooling of brakes.

GENERAL

Ident.: DSC-32-30-10-00018623.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

The main wheels are equipped with carbon multidisc brakes, which can be actuated by either of two independent brake systems.

The normal system uses green hydraulic pressure, whereas the alternate system uses the yellow hydraulic system backed up by the hydraulic accumulator.
An anti-skid and autobrake system is also provided.
Braking commands come from either the brake pedals (pilot action), or the autobrake system (deceleration rate selected by the crew).
Two units on each main gear monitor the temperature of the brakes.
All braking functions (normal and alternate braking control, anti-skid control, autobraking, brake temperature indication) are controlled by a two-channel Brake and Steering Control Unit (BSCU).
The main gear wheels are fitted with fusible plugs which protect against tire burst, in the event of overheat.
Main gear wheels are also equipped with brake cooling fans ◁ , which permit a high speed cooling of brakes.

ANTI-SKID SYSTEM

Ident.: DSC-32-30-10-00018624.0001001 / 21 MAR 16
Applicable to: ALL

The antiskid system provides maximum braking efficiency by maintaining the wheels at the limit of an impending skid.
At skid onset, brake release orders are sent to the normal and alternate servovalves, as well as to the ECAM system which displays the released brakes.
Without using autobrake, full braking performance is achieved only with brake pedals at full deflection.
The antiskid system is deactivated below 20 kt (ground speed).
An ON/OFF switch activates, or deactivates, the antiskid and nosewheel steering systems.

PRINCIPLE

The speed of each main gear wheel (given by a tachometer) is compared to the aircraft speed (reference speed). When the speed of a wheel decreases below approximately 0.87 times (depending on conditions) reference speed, brake release orders are given to maintain the wheel slip at that value (best braking efficiency).
In normal operation, the reference speed is determined by the BSCU from the horizontal acceleration of ADIRU 1, or ADIRU 2, or ADIRU 3.
In case all ADIRUs fail, reference speed equals the maximum of either main landing gear wheel speeds.

AUTO BRAKE

Ident.: DSC-32-30-10-A-00018625.0001001 / 21 MAR 16
Applicable to: ALL

GENERAL

The purposes of the autobrake system are the following:
- Reduce the braking distance in case of an aborted takeoff
- Establish and maintain a selected deceleration rate during landing, thereby improving passenger comfort and reducing crew workload.

Ident.: DSC-32-30-10-A-00018626.0003001 / 09 NOV 17
2 **Applicable to: MSN 02734, 02896, 04827-04860, 05947-05987, 06634, 06871, 07081-07098, 10949-11597**

SYSTEM ARMING

The crew may arm the system by pressing the LO, MED, or MAX pushbutton provided all the following arming conditions are met:
- Green pressure available
- Anti-skid electrically-powered
- No failure in the braking system
- At least one ADIRU is available.

Note: *1. Auto brake may be armed with the parking brake on.*
2. MAX autobrake mode cannot be armed in flight.

The armed AUTO BRK mode is displayed in blue on the Flight Mode Annunciator (FMA).

Ident.: DSC-32-30-10-A-00018626.0002001 / 21 MAR 16
3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02887, 02904-03710, 03733-04773, 04953-05883, 06097, 06121, 06139-06632, 06658-06813, 06876-07005, 08495-09324**

SYSTEM ARMING

The crew may arm the system by pressing the LO, MED, or MAX pushbutton provided all the following arming conditions are met :
- Green pressure available
- Anti-skid electrically-powered
- No failure in the braking system
- At least one ADIRU is available.

Note: *1. Auto brake may be armed with the parking brake on.*
2. MAX autobrake mode cannot be armed in flight.

Ident.: DSC-32-30-10-A-00018627.0003001 / 09 NOV 17

4 **Applicable to: MSN 02734, 02896, 04827-04860, 05947-05987, 06634, 06871, 07081-07098, 10949-11597**

SYSTEM ACTIVATION

Automatic braking is activated when:

- The command for ground spoilers extension is detected (*Refer to DSC-27-10-20 Speed Brakes and Ground Spoilers - Speed Brake Control*), for LO and MED mode, or
- The command for ground spoilers extension is detected, and the wheel speed is above 40 kt, for MAX mode.

Therefore, if the aircraft makes an acceleration stop and begins to decelerate when the wheel speed is under 72 kt, the automatic braking will not activate because the ground spoilers will not extend.
For autobrake to activate, at least two SEC's must be operative.
The active AUTO BRK mode is displayed in green on the Flight Mode Annunciator (FMA).

Ident.: DSC-32-30-10-A-00018627.0002001 / 17 OCT 17

SYSTEM ACTIVATION

Automatic braking is activated when:

- The command for ground spoilers extension is detected (*Refer to DSC-27-10-20 Speed Brakes and Ground Spoilers - Speed Brake Control*), for LO and MED mode, or
- The command for ground spoilers extension is detected, and the wheel speed is above 40 kt, for MAX mode.

Therefore, if the aircraft makes an acceleration stop and begins to decelerate when the wheel speed is under 72 kt, the automatic braking will not activate because the ground spoilers will not extend.
For autobrake to activate, at least two SEC's must be operative.

Ident.: DSC-32-30-10-A-00018628.0001001 / 21 MAR 16

Applicable to: ALL

SYSTEM DEACTIVATION

The system deactivates when:

- The system disarmed (*Refer to DSC-32-30-10 Auto Brake - System Disarming*), or
- The ground spoilers retract. In this case it remains armed.

Ident.: DSC-32-30-10-A-00018629.0002001 / 09 NOV 17
Applicable to: ALL

SYSTEM DISARMING

The system disarms when:
- Flight crew presses the pushbutton switch, or
- One or more arming conditions is lost, or
- After take-off/touch and go, or
- Flight crew applies enough deflection to at least one brake pedal when autobrake is active in MAX, MED or LO mode.

BRAKING MODES

Ident.: DSC-32-30-10-B-00018630.0001001 / 21 MAR 16
Applicable to: ALL

GENERAL

There are four modes of operation:
- Normal braking
- Alternate braking with antiskid
- Alternate braking without antiskid
- Parking brake.

Ident.: DSC-32-30-10-B-00018631.0001001 / 21 MAR 16
Applicable to: ALL

NORMAL BRAKING

Normal braking is operative when:
- Green hydraulic pressure is available
- A/SKID & N/W STRG switch is ON.

During normal braking, antiskid is operative and autobrake is available.

Braking is electrically-controlled through the BSCU from:
- Pilot's pedals, or
- Automatically activates when:
  - On ground by the autobrake system, or
  - In flight when the landing gear lever is up.

The antiskid system is controlled by the BSCU via the normal servo valves.
There is no brake pressure indication in the cockpit.

Ident.: DSC-32-30-10-B-00018632.0002001 / 17 MAR 17

6 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

ALTERNATE BRAKING WITH ANTI-SKID

Autobrake is inoperative.

Braking uses this mode when green hydraulic pressure is insufficient, and :
- Yellow hydraulic pressure is available
- A/SKID & N/W STRG switch is ON
- Parking brake is not ON.

Braking inputs are made by the brake pedals and sent to the ABCU. Then, taking into account the brake pedal input, the ABCU:
- Energizes the alternate brake selector valve to pressurize the yellow hydraulic circuit
- Electrically controls the Alternate Servo Valve to obtain the correct pressure for the related brakes.

Antiskid is controlled by the BSCU.
A triple indicator on the center instrument panel indicates the pressure delivered to the left and right brakes, as well as the accumulator pressure.

Note: *Initial pedal force or displacement produces more braking action in alternate mode than in normal mode.*

Ident.: DSC-32-30-10-B-00018632.0001001 / 17 MAR 17

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

ALTERNATE BRAKING WITH ANTI-SKID

Autobrake is inoperative.

Braking uses this mode when green hydraulic pressure is insufficient, and :
- Yellow hydraulic pressure is available
- A/SKID & N/W STRG switch is ON
- Parking brake is not ON.

An automatic hydraulic selector changes from the green to the yellow system.
The pedals brake through the auxiliary low-pressure hydraulic distribution line acting on the dual valves. The BSCU controls the anti-skid system via the alternate servo valves.
A triple indicator on the center instrument panel indicates the pressure delivered to the left and right brakes, as well as the accumulator pressure.

Note: *Initial pedal force or displacement produces more braking action in alternate mode than in normal mode.*

Ident.: DSC-32-30-10-B-00018633.0002001 / 17 MAR 17

7 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

ALTERNATE BRAKING WITHOUT ANTI-SKID

Autobrake and antiskid are inoperative.

The antiskid system is either deactivated:
- Electrically (A/SKID & N/W STRG sw OFF, or power supply failure, or BSCU failure), or
- Hydraulically (Y + G system low pressure, the brakes are supplied by the brake accumulator only).

Depending on the brake pedals' demand, the ABCU controls the alternate brake selector and the alternate servovalves.
Brake pressure and accumulator pressure are indicated on a triple indicator, located on the center instrument panel. To avoid wheel locking and limit the risk of tire burst, brake pressure is automatically limited to 1 000 PSI.
The accumulator can supply at least 7 full brake applications.

Note: *Initial pedal force or displacement produces more braking action in alternate mode than in normal mode.*

Ident.: DSC-32-30-10-B-00018633.0001001 / 28 SEP 17

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

ALTERNATE BRAKING WITHOUT ANTI-SKID

Autobrake is inoperative.

The anti-skid system can be deactivated:
- Electrically (A/SKID & N/W STRG sw OFF, or power failure or BSCU failure), or
- Hydraulically (low pressure in both green and yellow systems, brakes being supplied by the brake accumulator only).

The pilot controls the braking with the pedals (acting on the dual valves).
Alternate servo valves are fully open.
Brake pressure and accumulator pressure are indicated on a triple indicator, located on the center instrument panel. The pilot must modulate brake pressure at, or below, 1 000 PSI in order to avoid wheel locking.
The accumulator can supply at least 7 full brake applications.

Note: *Initial pedal force or displacement produces more braking action in alternate mode than in normal mode.*

Ident.: DSC-32-30-10-B-00018634.0002001 / 21 MAR 16

8 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

PARKING BRAKE

Brakes are supplied by the yellow hydraulic system, or by accumulator pressure via the parking brake control valve, which opens allowing full pressure application on the main gear wheel brakes.
The accumulator maintains the parking pressure for at least 12 h.
If the parking brake is activated and no yellow hydraulic or accumulator brake pressure is available, then the normal braking system can be applied via the brake pedals.
Yellow accumulators can be pressurized by pressing the yellow electrical pump switch.
A triple indicator on the center instrument panel indicates the pressure delivered to the left and right brakes, as well as the accumulator pressure.

Ident.: DSC-32-30-10-B-00018634.0001001 / 21 MAR 16

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

PARKING BRAKE

Brakes are supplied by the yellow hydraulic system, or by accumulator via the dual shuttle valves.
Alternate servo valves open allowing full pressure application.
The accumulator maintains the parking pressure for at least 12 h.
If the parking brake is activated and no yellow hydraulic or accumulator brake pressure is available, then the normal braking system can be applied via the brake pedals.
Yellow accumulators can be pressurized by pressing the yellow electrical pump switch.
A triple indicator on the center instrument panel indicates the pressure delivered to the left and right brakes, as well as the accumulator pressure.

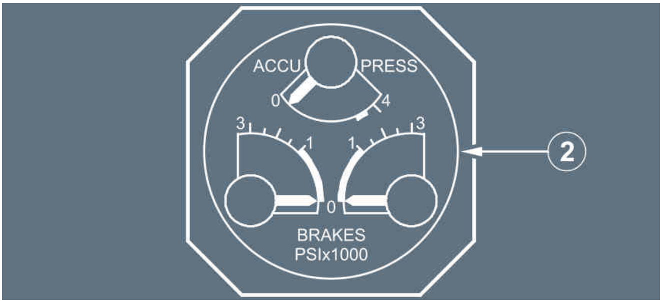
ON : If green hydraulic pressure is available:
- Antiskid is available
- Nosewheel steering is available.

If green hydraulic pressure is lost, then:
- Yellow hydraulic pressure automatically takes over to supply the brakes
- Antiskid remains available
- Nosewheel steering is lost
- Triple indicator displays yellow system brake pressure.

OFF : The yellow hydraulic system supplies pressure to the brakes.
- Antiskid is deactivated. The pilot must refer to the triple indicator to limit brake pressure and avoid locking a wheel
- Nosewheel steering is lost
- Differential braking remains available through the pedals
- Triple indicator displays yellow system brake pressure.



(2) BRAKES and ACCU PRESS indicator

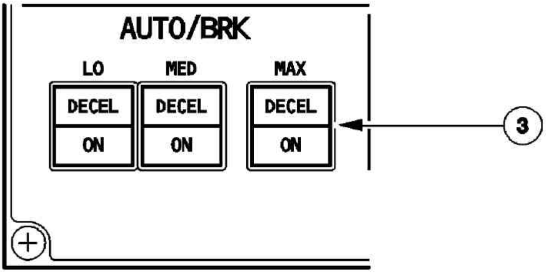
ACCU PRESS : Indicates the pressure in the yellow brake accumulator.

BRAKES : Indicates the yellow pressure delivered to the left and right brakes, as measured upstream of the alternate servovalves.

AUTO BRK PANEL

Ident.: DSC-32-30-20-00018636.0004001 / 21 MAR 16

2 **Applicable to: MSN 01246, 01376-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 05005-05987, 06097, 06121, 06139-06876, 06949-09324, 10949-11597**



(3) AUTO/BRK panel

The springloaded MAX, MED, and LO pushbutton switches arm the appropriate deceleration rate. The usage for each mode are as follow:

- MAX mode is normally selected for takeoff.
  In the case of an aborted takeoff, maximum pressure goes to the brakes, as soon as the system generates the ground spoiler deployment order
- MED or LO mode is normally selected for landing:
  - MED mode sends progressive pressure to the brakes 2 s after the ground spoilers deploy in order to decelerate the aircraft at 3 m/s^2 (9.8 ft/s^2)
  - LO mode sends progressive pressure to the brakes 2 s after the ground spoilers deploy, in order to decelerate the aircraft at 2 m/s^2 (6.6 ft/s^2).

The lighting on the pushbutton switches are as follow:

ON light : comes on blue to indicate positive arming

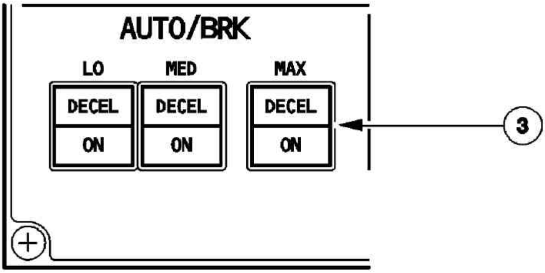
DECEL light : comes on green when the actual deceleration is 80 % of the selected rate

Note: *On slippery runways, the predetermined deceleration may not be reached, due to antiskid operation. In this case, the DECEL light will not come on. This does not mean that autobrake is not working.*

Off : The corresponding autobrake mode is not armed

AUTO BRK PANEL

Ident.: DSC-32-30-20-00018636.0002001 / 21 MAR 16
Applicable to: MSN 01143-01158, 01251, 04827-04974, 06895



(3) AUTO/BRK panel

The springloaded MAX, MED, and LO pushbutton switches arm the appropriate deceleration rate. The usage for each mode are as follow:

- MAX mode is normally selected for takeoff.
  In the case of an aborted takeoff, maximum pressure goes to the brakes, as soon as the system generates the ground spoiler deployment order
- MED or LO mode is normally selected for landing:
  - MED mode sends progressive pressure to the brakes 2 s after the ground spoilers deploy in order to decelerate the aircraft at 3 m/s^2 (9.8 ft/s^2)
  - LO mode sends progressive pressure to the brakes 4 s after the ground spoilers deploy, in order to decelerate the aircraft at 1.7 m/s^2 (5.6 ft/s^2).

The lighting on the pushbutton switches are as follow:

ON light : comes on blue to indicate positive arming

DECEL light : comes on green when the actual deceleration is 80 % of the selected rate

Note: On slippery runways, the predetermined deceleration may not be reached, due to antiskid operation. In this case, the DECEL light will not come on. This does not mean that autobrake is not working.

Off : The corresponding autobrake mode is not armed

BRAKE FAN ⩤

RELEASE INDICATOR

≡	Appears temporarily after the landing gear has been lowered to indicate that the anti-skid function is ready.
≡1 ≡-REL-≡2≡	Reappears after touchdown, along with REL, when the anti-skid is active.
≡	Appears in case of brake released fault.

A/SKID

A/SKID	Appears along with an ECAM alert in case of total BSCU failure, or when the A/SKID & N/W STRG sw is OFF, or if the BSCU detects an ANTI-SKID failure.

AUTO BRK

AUTO BRK	Appears when auto brake is armed, and flashes for 10 s after autobrake disengagement.
AUTO BRK	Appears along with an ECAM alert, to indicate a system failure.

AUTO BRK
MED

MED, LO, or MAX appears underneath to show which rate has been selected.

WHEEL NUMBER

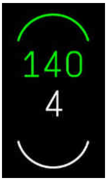
1

This number identifies individual wheels of the main landing gear.

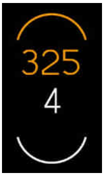
BRAKE TEMPERATURE

140

The brake temperature is normal.



Green arc appears on the hottest wheel when one brake temperature exceeds 100 °C.



Green arc becomes amber, and an ECAM alert is triggered, when the corresponding brake temperature exceeds 300 °C.

ALTN BRK

ALTN BRK

Appears if the braking system is in alternate mode.

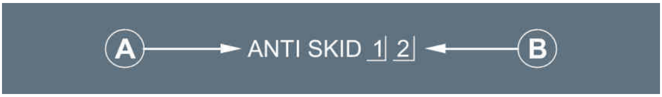
(1) Release indicators

🟩 It appears in amber in case of brake released fault.

(2) ANTI SKID indication



A
ANTI SKID 1 2
B

(A) ANTISKID label

It appears in amber, a long with an ECAM caution, in case of a total BSCU failure, or when the A/SKID & N/W STRG sw is OFF, or if the BSCU detects an ANTI-SKID failure, or in case of normal braking and yellow hydraulic system low pressure.

It appears in green in case of autobrake, normal braking, or alternate braking failure, and antiskid is still available.

(B) BSCU channel indication

When ANTISKID label is displayed, the number of the failed system(s) is (are) displayed in amber, if any.

(3) AUTO BRK

This legend appears:
- In green when auto brake is armed, or
- Flashing green for 10 s after autobrake disengagement, or
- In amber, along with an ECAM caution, to indicate a system failure.

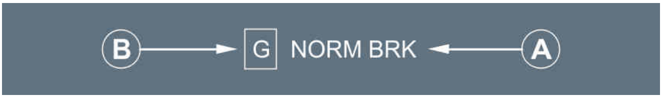
MED, LO, or MAX appears underneath in green to show which rate has been selected.

(4) Wheel number
This white number identifies individual wheels of the main landing gear.

(5) Brake temperature

- Temperature normally appears in green.
- Green arc appears on the hottest wheel when one brake temperature exceeds 100 °C.
- Green arc becomes amber, and an ECAM caution appears, when the corresponding brake temperature exceeds 300 °C.

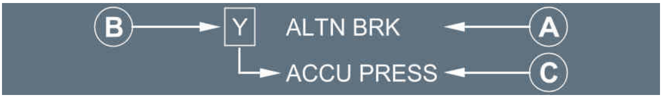
(6) NORM BRK indication



(A) NORM BRK label
This indication appears in green when autobrake or alternate braking is failed, and normal braking is still available.
The legend appears in amber when normal braking is failed due to total BSCU failure, or to the loss of the green hydraulic pressure, or to the loss of antiskid.

(B) NORM BRK hydraulic supply indication
G is displayed when the NORM BRK label is displayed. It is green when green hydraulic pressure is available and amber, in case of green hydraulic low pressure.

(7)



(A) ALTN BRK label
This indication appears in green, if the braking system is in alternate mode and not failed, or in case autobrake or normal braking is failed and alternate braking is still available.
This indication appears in amber when alternate braking is failed.

(B) ALTN BRK hydraulic supply indication
Y is displayed when the ALTN BRK label is displayed. It is green when yellow hydraulic pressure is available and amber, in case of yellow hydraulic low pressure.

GENERAL

Ident.: DSC-33-10-10-00017615.0001001 / 21 MAR 16
Applicable to: ALL

The instrument panel has both integral instrument lighting and flood lighting.
The brightness of all panel lighting is adjustable.
Spot lights and flood lights provide lighting for all work surfaces and the side consoles.
Two dimmable dome lights provide lighting for the overall cockpit. When the batteries are supplying electrical power, only the right-hand dome light is on line.

Intentionally left blank

DESCRIPTION

Ident.: DSC-33-10-20-00017616.0001001 / 11 SEP 18
Applicable to: ALL

INTEGRATED LIGHTING FOR INSTRUMENTS AND PANELS

All instruments and panels in the cockpit (other than display units) have integral lighting.
The flight crew can adjust the brightness of all integral lighting.

ANNUNCIATOR LIGHTS

The ANN LT sw on the overhead panel controls the brightness of all the annunciator lights in the cockpit.
The ANN LT sw sets the brightness of all annunciator lights at the same level.
The flight crew can test the annunciator lights with the following procedure: Set the ANN LT sw to the TEST position, and check to see that all the annunciator lights come on.

DOME LIGHTS

Two dome lights provide the cockpit with shadow-free lighting.

MAP HOLDER LIGHTING

Each flight crewmember has a map holder that can be lighted.

CONSOLE AND BRIEFCASE LIGHTING

Each flight crewmember has lighting for briefcase stowage, the side console, and the floor.

CENTER INSTRUMENT PANEL

Lights under the glareshield provide lighting for the center instrument panel.

STANDBY COMPASS

The standby compass has integral lighting.

READING LIGHTS

Each flight crewmember has a reading light.

PEDESTAL LIGHTING

A flood light in the middle of the overhead panel provides lighting for the center pedestal.

OVERHEAD PANEL

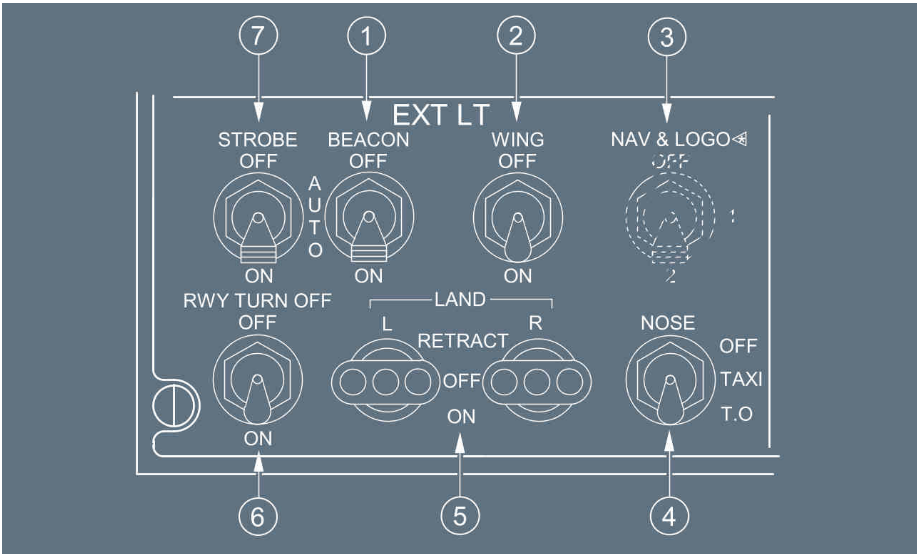
Ident.: DSC-33-20-20-00017623.0004001 / 21 MAR 16

Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876



(1) BEACON sw

This switch turns on and off the two flashing red lights, one on top and one on the bottom of the fuselage.

(2) WING sw

This switch turns on and off two beam lights on each side of the fuselage. These lights provide lighting on the wing leading edge and on the engine air intake to detect ice accretion.

(3) NAV & LOGO ◁ sw

There are single navigation light, or dual navigation lights ◁ on each wing and in the APU tail cone.

A blue light ◁ below each navigation light allows to monitor the navigation light wear (LED technology). When the NAV & LOGO ◁ sw is ON, this light ◁ flashes in blue if the navigation light replacement should be planned.

There are logo lights ◁ in the upper surface of each horizontal stabilizer. These light provide lighting for the company logo on the vertical stabilizer provided the main landing gears are compressed, or depending on the aircraft configuration, when flaps are extended (at least 15 ° on some aircraft) or slats are extended.

The NAV & LOGO ◁ sw can have one of the following configuration:

	ON : Turns on the NAV and the LOGO lights ◁ . OFF : The NAV and the LOGO lights ◁ are off.

or

	2 : Turns on NAV 2 and the LOGO lights ◁ . 1 : Turns on NAV 1 and the LOGO lights ◁ . OFF : The NAV and the LOGO lights ◁ are off.

(4) NOSE sw

This switch turns the taxi and takeoff lights on and off.

TO : Turns on both taxi and takeoff lights.

TAXI : Turns on only taxi light.

OFF : Taxi and takeoff lights off.

Note: These two lights, attached to the nose gear strut, go off automatically when landing gear is retracted.

(5) L and R LAND sel

These selectors control the landing lights.

ON : Extends the (left or right) landing lights which come on automatically when fully extended.

OFF : Shuts off the landing lights which remain extended.

RETRACT : Shuts off and retracts the landing lights.

(6) RWY TURN OFF sw

This switch turns the runway turn-off lights on and off.

Note: These lights go off automatically when landing gear is retracted.

(7) STROBE sw

This switch turns on and off the three synchronized strobe lights, one on each wing and one below the tail cone.

A blue light ◁ below each strobe light allows to monitor the strobe light wear (LED technology). When STROBE sw is OFF or BEACON sw is ON, this light ◁ flashes in blue if the strobe light replacement should be planned.

ON	:	The strobe lights flash white.
AUTO	:	The strobe lights come on automatically when the main landing gear is not compressed.
OFF	:	The strobe lights are off.

OFF : Taxi and takeoff lights off.

Note: These two lights, attached to the nose gear strut, go off automatically when landing gear is retracted.

(5) L and R LAND sel

These selectors control the landing lights.

ON : Extends the (left or right) landing lights which come on automatically when fully extended.

OFF : Shuts off the landing lights which remain extended.
RETRACT : Shuts off and retracts the landing lights.

(6) RWY TURN OFF sw

This switch turns the runway turn-off lights on and off.

Note: These lights go off automatically when landing gear is retracted.

(7) STROBE sw

This switch turns on and off the three synchronized strobe lights, one on each wing and one below the tail cone.

A blue light ◁✳ below each strobe light allows to monitor the strobe light wear (LED technology). When STROBE sw is OFF or BEACON sw is ON, this light ◁✳ flashes in blue if the strobe light replacement should be planned.

ON : The strobe lights flash white.
AUTO : The strobe lights come on automatically when the main landing gear is not compressed.
OFF : The strobe lights are off.

GENERAL

Ident.: DSC-33-30-10-00017632.0001001 / 27 FEB 18
Applicable to: ALL

The emergency lighting system consists of the following:
- Proximity emergency escape path marking systems (escape path and exit markers)
- Overhead emergency lights
- EXIT signs
- Lavatory auxiliary lights
- Overwing escape route ◁ lighting
- Escape slide lighting.

For aircraft equipped with electrical escape paths or electrical exit markers, internal batteries supply electrical power for at least 12 min.
Lavatory auxiliary lights are always on.
The escape slides have an integral lighting system. The escape slide lights and overwing escape route ◁ lights come on automatically when the slide is armed and the door or emergency exit is open. They are supplied by internal batteries.

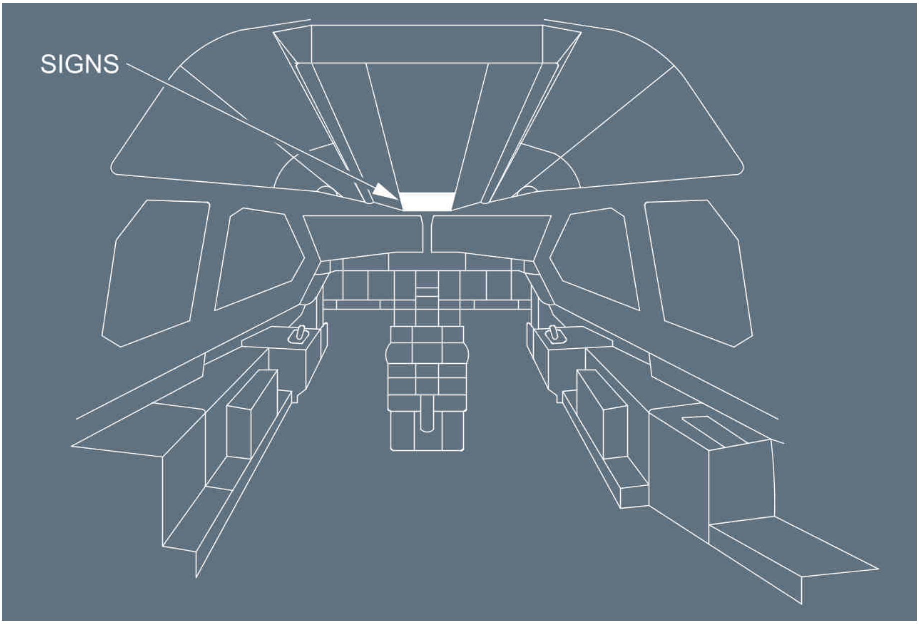
OVERHEAD PANEL

Ident.: DSC-33-40-10-00017709.0001001 / 21 MAR 16
Applicable to: ALL



The switches described below are installed on the SIGNS panel on the overhead panel.

The cabin signs consist of the following:
- A SEAT BELTS sw, and
- A NO SMOKING sw ◁✳ , or
- An EXIT sw ◁✳ , or
- A NO PORTABLE ELEC DEVICE sw ◁✳ .

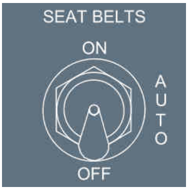
The SEAT BELTS sw activates the FASTEN SEAT BELT and RETURN TO YOUR SEAT signs.
The NO SMOKING sw ◁✳ or EXIT sw ◁✳ activate the EXIT and NO SMOKING signs.
The NO PORTABLE ELEC DEVICE sw ◁✳ activates the EXIT and NO MOBILE signs.
A low tone chime sounds (depending on CIDS/CAM programming) each time a sign goes on or off.
Each switch has 3 positions:

ON : Signs are on in the cabin

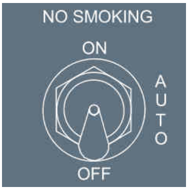
AUTO : ◁✳ Signs are on in the cabin when either landing gear is extended or flaps/slats are extended (position 1, 2, 3, or FULL)

OFF : Signs are off in the cabin

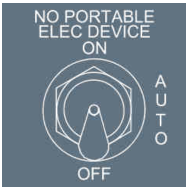
Example of switches layout:



SEAT BELTS
ON
AUTO
OFF



NO SMOKING
ON
AUTO
OFF



NO PORTABLE
ELEC DEVICE
ON
AUTO
OFF

Note: 1. *If the cabin altitude goes above 11 300 ft (± 350 ft), the cabin lights (depending on CIDS/CAM programming) and all the cabin signs, except the NO PORTABLE ELEC DEVICE signs ◁ come on regardless of switches position.*

2. *For NON SMOKER ◁ , the NO SMOKING signs are always on.*

MEMO DISPLAY

Ident.: DSC-33-40-10-00016783.0001001 / 05 MAY 22

Applicable to: ALL

When the corresponding signs are on, the ECAM displays SEAT BELTS, NO SMOKING or NO PED or NO MOBILEmessages, depending on aircraft customization.

GENERAL

Ident.: DSC-34-NAV-10-10-00018524.0001001 / 21 MAR 16
Applicable to: ALL

The Air Data and Inertial Reference System (ADIRS) supplies temperature, anemometric, barometric and inertial parameters to the EFIS system (PFD and ND) and to other user systems (FMGC, FADEC, ELAC, SEC, FAC, FWC, SFCC, ATC, GPWS, CFDIU, CPC).

The system includes:

- Three identical ADIRUs (Air Data and Inertial Reference Units).

  Each ADIRU is divided in two parts, either of which can work separately in case of failure in the other:
  - The ADR part (Air Data Reference) which supplies barometric altitude, airspeed, Mach, angle of attack, temperature and overspeed warnings.
  - The IR part (Inertial Reference) which supplies attitude, flight path vector, track, heading, accelerations, angular rates, ground speed and aircraft position.

- One ADIRS control panel on the overhead panel for selection of modes (NAV, ATT, OFF) and indications of failures.
- Four types of sensors:
  - Pitot probes (3)
  - Static pressure probes (STAT) (6)
  - Angle of attack sensors (AOA) (3)
  - Total air temperature probes (TAT) (2)

  These sensors are electrically heated to prevent from icing up.
- Eight ADMs (Air Data Modules) which convert pneumatic data from PITOT and STAT probes into numerical data for the ADIRUs.
- A switching facility for selecting ADR3 or IR3 for instrument displays in case of ADIRU1 or 2 failure.

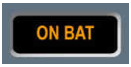
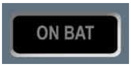
ON BAT LIGHT



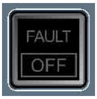
Batteries supply at least one ADIRU. The ON BAT light also comes on for a few seconds at the beginning of a complete IRS alignment.
The ON BAT light does not come on in the case of a fast alignment.

Note: *When the aircraft is on ground and if at least one ADIRU is supplied by aircraft batteries:*
- *An external horn sounds*
- *The ADIRU and AVNCS lights come on amber on the EXTERNAL POWER panel.*

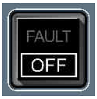


One of the following applies:
- All three ADIRUs are on, and not supplied by batteries, or
- All three ADIRUs are off.

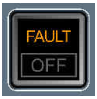
IR1(2)(3) PB SW



IR 1(2)(3) is on.
When pressed, turns off the IR 1(2)(3).

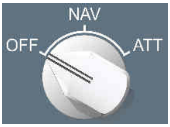


IR 1(2)(3) is off.
When pressed, turns on the IR 1(2)(3).

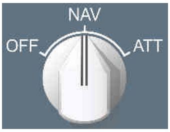


IR 1(2)(3) is failed.
Associated with the following ECAM alert: NAV IR 1(2)(3) FAULT(*Refer to procedure*).
When IR 1(2)(3) FAULT light flashes, the attitude and heading information may be recovered in ATT mode.
When IR 1(2)(3) FAULT light is steady, the IR 1(2)(3) is lost.
When pressed, turns off the IR 1(2)(3). The FAULT light goes off.

IR1(2)(3) MODE SELECTOR

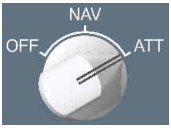


ADIRU 1(2)(3) is not energized.
Both the IR 1(2)(3) data and the ADR 1(2)(3) data are not available.



IR 1(2)(3) operates in NAV mode
IR 1(2)(3) provides full inertial data to the aircraft systems.

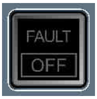
Note: *ADR 1(2)(3) provides full air data to the aircraft systems.*



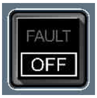
IR 1(2)(3) operates in ATT mode.
IR 1(2)(3) only provides attitude and heading data (if entered by the flight crew). The navigation data are not available.
The heading must be entered through the MCDU and has to be reset frequently (about every 10 min).

During the flight, if the IR mode selector is set from NAV to ATT or NAV to OFF, the NAV mode is lost for the remainder of the flight.

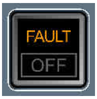
ADR 1(2)(3) PB SW



ADR 1(2)(3) is on.
When pressed, turns off the ADR 1(2)(3).



ADR 1(2)(3) is off.
When pressed, turns on the ADR 1(2)(3).



ADR 1(2)(3) is failed.
Associated with the following ECAM alert: NAV ADR 1(2)(3) FAULT(*Refer to procedure*).
When pressed, turns off the ADR 1(2)(3). The FAULT light goes off.

OVERHEAD PANEL

Ident.: DSC-34-NAV-10-20-00018528.0001001 / 17 MAY 21
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03662

The ADIRS CDU on the overhead panel provides the controls and indicators to permit:
- Selection of power supplies to the ADR and IRS systems
- Selection and display of navigation data
- Status and fault indication of IRS or ADRs.
- Manual initialization of IRS

Note: *IRS are normally initialized with the FMGC, but IRS may be initialized with the ADIRS CDU as a backup.*

Used to enter the present position (or the present magnetic heading in ATT mode).

The integral cue light comes on after an entry operation if the data has an unreasonable value.

When pressed, clears the data display that has been keyed in but not yet entered.

The integral cue light comes on when a flight crew has keyed in a number for N, S, W, E or H ◁✳ .

When pressed, enters the data that has been keyed into the ADIRS.

ON BAT LIGHT

Batteries supply at least one ADIRU. The ON BAT light also comes on for a few seconds at the beginning of a complete IRS alignment.
The ON BAT light does not come on in the case of a fast alignment.

Note: *When the aircraft is on ground and if at least one ADIRU is supplied by aircraft batteries:*
- *An external horn sounds*
- *The ADIRU and AVNCS lights come on amber on the EXTERNAL POWER panel.*

One of the following applies:
- All three ADIRUs are on, and not supplied by batteries, or
- All three ADIRUs are off.

IR 1(2)(3) LIGHT

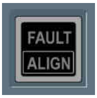
FAULT
ALIGN

IR 1(2)(3) is failed.
Associated with the following ECAM alert: NAV IR 1(2)(3) FAULT(*Refer to procedure*).
When IR 1(2)(3) FAULT light flashes, the attitude and heading information may be recovered in ATT mode.
When IR 1(2)(3) FAULT light is steady, the IR 1(2)(3) is lost.

FAULT
ALIGN

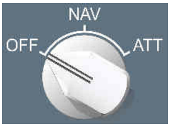
When IR 1(2)(3) ALIGN light is steady, IR 1(2)(3) is operating normally in align mode.

IR 1(2)(3) ALIGN light flashes when:
- The IR alignment fault, or
- No present position entry after 10 min, or
- There is a difference between the position at shutdown and the entered position exceeds 1 ° of latitude or longitude.

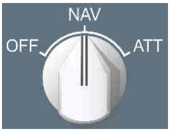


The alignment of IR 1(2)(3) has been completed.

IR MODE SELECTOR

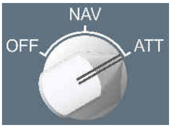


ADIRU 1(2)(3) is not energized.
Both the IR 1(2)(3) data and the ADR 1(2)(3) data are not available.



IR 1(2)(3) operates in NAV mode
IR 1(2)(3) provides full inertial data to the aircraft systems.

Note: *ADR 1(2)(3) provides full air data to the aircraft systems.*



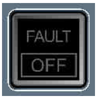
IR 1(2)(3) operates in ATT mode.
IR 1(2)(3) only provides attitude and heading data (if entered by the flight crew). The navigation data are not available.

The heading must be entered using:
- The CDU keyboard, or
- The MCDU (if the entry field is available).

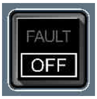
The heading has to be reset frequently (about every 10 min).

During the flight, if the IR mode selector is set from NAV to ATT or NAV to OFF, the NAV mode is lost for the remainder of the flight.

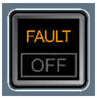
ADR 1(2)(3) PB SW



ADR 1(2)(3) is on.
When pressed, turns off the ADR 1(2)(3).



ADR 1(2)(3) is off.
When pressed, turns on the ADR 1(2)(3).



ADR 1(2)(3) is failed.
Associated with the following ECAM alert: NAV ADR 1(2)(3) FAULT(*Refer to procedure*).
When pressed, turns off the ADR 1(2)(3). The FAULT light goes off.

PEDESTAL

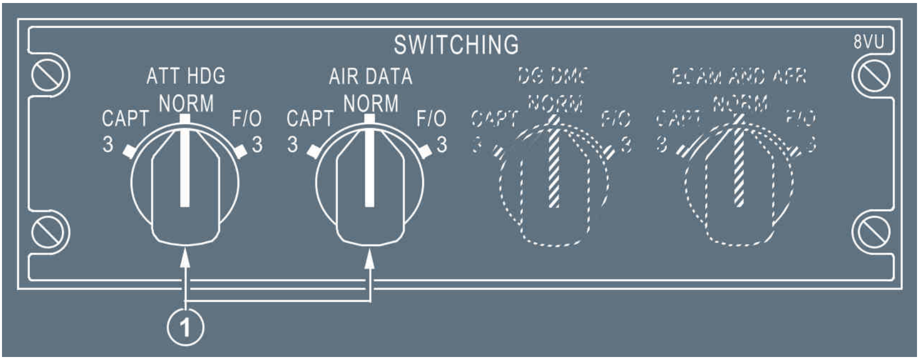
Applicable to: ALL



(1) ATT HDG and AIR DATA sel

NORM : ADIRU1 supplies data to PFD1, ND1, DDRMI ⊲ and VOR/DME.
ADIRU 2 supplies data to PFD 2, and ND2.

CAPT 3 : ADR3 or IR3 replaces ADR1 or IR1.

F/O 3 : ADR 3 or IR3 replaces ADR 2 or IR2.

MEMO DISPLAY

Ident.: DSC-34-NAV-10-20-A-00025044.0001001 / 18 NOV 21
2 **Applicable to: MSN 08495-09324, 10949-11597**

ADIRS SWTG : This memo appears when one of the following is applicable:
- AIR DATA rotary selector is selected at CAPT 3 or F/O 3 without the activation of BKUP SPD/ALT pb on the same side, or
- ATT HDG rotary selector is selected at CAPT 3 or F/O 3.

Ident.: DSC-34-NAV-10-20-A-00017043.0002001 / 21 MAR 16
3 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

IR IN ATT ALIGN : This memo appears in green during the IR alignment in Attitude mode.

Ident.: DSC-34-NAV-10-20-A-00017042.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03662

IRS IN ALIGN : This memo appears in green if one of the 3 IRS is still in alignment and both engines are stopped.

IRS IN ALIGN	:	This memo appears in amber if one of the 3 IRS is still in alignment and one engine is running.

Ident.: DSC-34-NAV-10-20-A-00017041.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03662

IRS IN ALIGN X MN : This memo appears in green, if both engines are stopped. The memo "IRS IN ALIGN X MN" appears during flight phase 1 or 2, if:

- At least one active IRS is in ALIGN submode
- The remaining time until NAV mode is obtained in X minutes (1 < X < 10).

IRS IN ALIGN X MN : This memo appears in amber, if one engine is running. The memo "IRS IN ALIGN X MN" appears during flight phase 1 or 2, if:

- At least one active IRS is in ALIGN submode
- The remaining time until NAV mode is obtained in X minutes (1 < X<10).

Ident.: DSC-34-NAV-10-20-A-00017041.0002001 / 21 MAR 16
4 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The memo "IRS IN ALIGN X MN" appears during IRS alignment in flight phase 1 or 2. X MN indicates the number of remaining minutes (1 < X < 10), until NAV mode is reached.
Before any engine is started:

IRS IN ALIGN X MN : This memo appears in green when at least one active IRS is being aligned.

IRS IN ALIGN X MN : This memo pulses in green, if the alignment of one IRS is faulty.

When one engine is started:

IRS IN ALIGN X MN : This memo appears in amber during IRS alignment. If the alignment of one IRS is faulty, this memo is replaced by the “IR NOT ALIGNED” ECAM caution.

MAXIMUM DIFFERENCES BETWEEN SPEED/MACH INDICATIONS

Ident.: DSC-34-NAV-10-20-00021130.0001001 / 10 MAY 21
Applicable to: MSN 01143-01251, 01459

The following table details the TSM values used to determine if a maintenance task is due when a difference between Speed/Mach indications is observed.
They are provided in order for flight crews to determine if indeed maintenance actions should be requested.

(1) *Mach values lower than M 0.50 in climb, and M 0.45 in descent, are not displayed on ISIS .*

ADIRS OPERATIONS - STATUS MESSAGES

Ident.: DSC-34-NAV-10-20-00021988.0001001 / 09 NOV 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03662

STATUS MESSAGES

Status messages appear, when the DISPLAY DATA switch is set to STS. If there is more than one condition calling for a message, the display scrolls to the next message every 2 s.

MESSAGE	DESCRIPTION
STS IR FAULT	Hard failure. Select ATT (if corresponding message is displayed) or refer to MMEL or remove ADIRU for maintenance.
STS-DELAY MAINT	Failure not affecting IR functioning. Service ADIRU when convenient.
STS-ENTER PPOS	Enter present position or check entered position is correct. Note: *The confirmation of an erroneous longitude at the present position entry will create a wrong position of the aircraft symbol on the NDs.*
STS-SELECT ATT	Hard IRU failure, select ATT mode.
STS-EXCESS MOTION	Excess motion detected during alignment. ADIRU will automatically restart alignment. Ensure aircraft is not moving.
STS-SWITCH ADR	ADR invalid.
STS-CHECK CK/BK	Check circuit breakers(1)
STS-CDU FAULT	Remove CDU for maintenance.
STS-ENT MAG HDG	Enter magnetic heading.

(1) *If a corresponding FAULT light comes on, check BAT 1 load.*

- If the prompt REALIGN IRS is displayed on the MCDU INIT page:
  Check and confirm the position initialization coordinates on the MCDU, then validate the REALIGN IRS prompt.

  Note: *The IRS records the last known position from the last time it was in NAV mode. The IRS is also able to estimate the present latitude during a complete alignment. The IRS uses both information sources to detect any significant position initialization error.*

Intentionally left blank

Backup Speed/Altitude Scale

BACKUP SPEED/ALTITUDE SCALE - GENERAL

Ident.: DSC-34-NAV-10-30-10-00019127.0002001 / 20 MAR 17
Applicable to: MSN 08495-09324

GENERAL

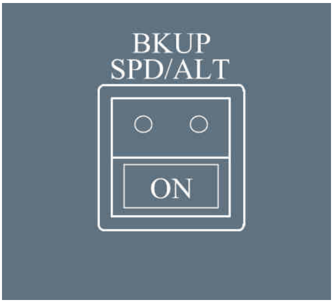
The BackUp Speed Scale (BUSS) enables to fly the aircraft when airspeed indications are unreliable.

When the BUSS is activated:
- The BUSS replaces the normal speed
- The GPS altitude replaces the barometric altitude scale.

The use of the BUSS is reversible.

The reversible BUSS is activated and deactivated with two BKUP SPD/ALT pb available on the main instrument panel:
- One on the left of the Captain PFD
- One on the right of the F/O PFD.

Each BKUP SPD/ALT pb independently commands the display of the BUSS on its associated side.



The BUSS information is based on the angle of attack (AOA), and depends on the slat/flap configuration.

ECAM ALERT AND MEMO

The ECAM displays a memo when the flight crew activates the BKUP SPD/ALT on one side: BKUP SPD/ALT.

The ECAM displays an alert when the flight crew activates the BKUP SPD/ALT:
- On one side with the AP and/or FD engaged on the same side,
  Refer to PRO-ABN-NAV NAV BKUP SPD/ALT ON CAPT(F/O) PFD, or
- On both sides,
  Refer to PRO-ABN-NAV NAV BKUP SPD/ALT ON CAPT+F/O PFD.

BACKUP SPEED/ALTITUDE SCALE - GENERAL

Ident.: DSC-34-NAV-10-30-10-00019127.0001001 / 16 MAY 17
Applicable to: MSN 02887, 04352-05987, 06097, 06121, 06139-07098

GENERAL

The BackUp Speed Scale (BUSS) enables to fly the aircraft when airspeed indications are unreliable.

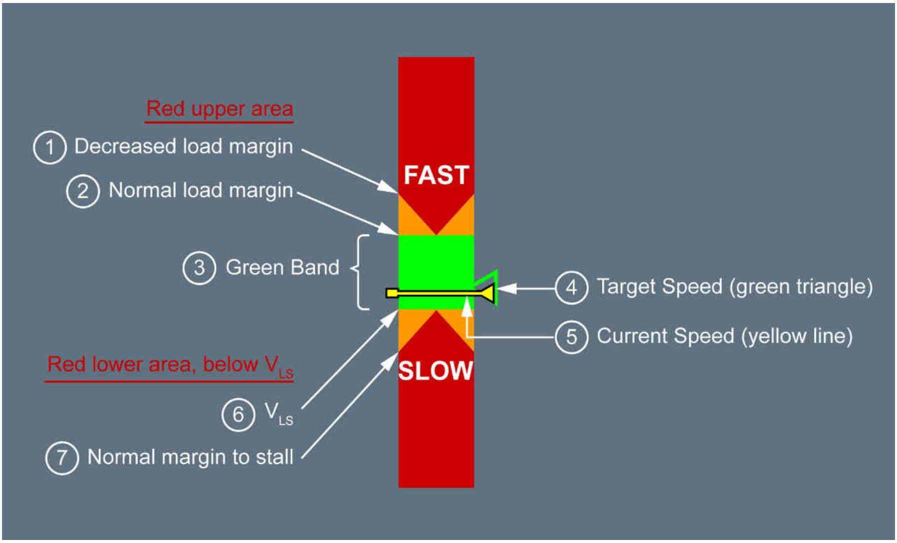
When the BUSS is activated:
- The BUSS replaces the normal speed,
- The GPS altitude replaces the barometric altitude scales.

The BUSS is displayed on both PFDs when the flight crew turn off all ADRs.
The activation of this BUSS is not reversible.
The BUSS information is based on the angle of attack (AOA), and depends on the slat/flap configuration.

BACKUP SPEED/ALTITUDE SCALE - BACKUP SPEED SCALE

Ident.: DSC-34-NAV-10-30-10-00019128.0001001 / 21 MAR 16
Applicable to: MSN 02887, 04352-05987, 06097, 06121, 06139-09324

BACKUP SPEED SCALE



Red upper area
1 Decreased load margin
2 Normal load margin
3 Green Band
Red lower area, below V_{LS}
6 V_{LS}
7 Normal margin to stall
FAST
SLOW
4 Target Speed (green triangle)
5 Current Speed (yellow line)

(1) Red FAST area
This area indicates the excessive speed range while decreasing the margin to the maximum structural speed.

(2) Amber FAST area
This area indicates the excessive speed range while keeping an appropriate margin to the maximum structural speed.

(3) Green area
The green area indicates the safe speed range.

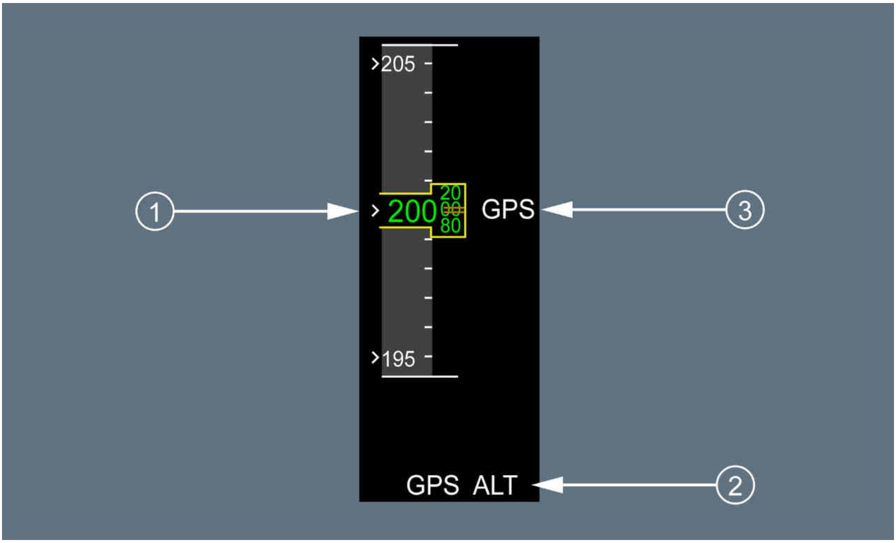
(4) Target speed (green triangle)
This symbol indicates the optimum target speed.
During the approach, it indicates the target speed for the approach.

(5) Actual speed reference (yellow line)
This line indicates the current speed of the aircraft.

(6) Amber SLOW area
This area indicates the too low speed range while keeping an appropriate margin to the stall speed.

(7) Red SLOW area
This area indicates the too low speed range while reducing the margin to the stall speed.

BACKUP ALTITUDE SCALE



(1) Current GPS altitude
Two amber dashes cover the last two digits.

(2) GPS ALT flag
This flag indicates that the barometric altitude is replaced by the GPS altitude.

(3) GPS flag (displayed depending of the aircraft configuration)
This flag indicates that the barometric altitude is replaced by the GPS altitude.

Note: The vertical speed indication is no longer displayed.

Digital Backup Speed/Altitude

SPEED MONITORING FUNCTION

Ident.: DSC-34-NAV-10-30-20-00023357.0001001 / 03 NOV 21

1 **Applicable to: MSN 10949-11597**

The Speed Monitoring Function is provided by FACs. This function uses four different speed sources:
- Three ADR speeds
- One Backup Speed.

Backup Speed is computed from AOA, load factor, aircraft weight, GPS altitude and aircraft configuration (ailerons, spoilers, THS, and slat/flap positions). Backup Speed has an accuracy of +/-15 kt with a flight domain restricted to 280 kt / M 0.78 in stable flight conditions with speed brakes retracted. Lower accuracy could be noticed during dynamic manoeuvres, aerodynamic modifications of the aircraft (Slats/Flaps transitions) or with speed brakes extended. Backup Speed is not available on ground until takeoff.

The Speed Monitoring Function consists in:
- The comparison between those four speed sources
- The individual monitoring of each ADR speed in order to detect icing conditions.

The speed monitoring function assigns a validity status to each speed source. This validity status can be: RELIABLE, FAULT or UNCERTAIN.
These validity status are displayed through ECAM and/or PFD/HUD ◁✻ to enhance crew awareness in the event of an unreliable speed situation.

ASSOCIATED ALERTS AND STATUS

Applicable to: MSN 10949-11597

Ident.: DSC-34-NAV-10-30-20-A-00023358.0001001 / 03 NOV 21

2

ASSOCIATED ALERTS

As soon as the speed monitoring function detects a change in the speed validity status, the following ECAM alert can be triggered:

- NAV AIR SPD STS CHANGED
  The NAV AIR SPD STS CHANGED alert appears as soon as the validity status of one speed source (ADR 1(2)(3) or backup speed) has changed.
  The validity status (RELIABLE, UNCERTAIN or FAULT) of all speed sources appears below the ECAM alert (*Refer to PRO-ABN-NAV NAV AIR SPD STS CHANGED - ANNUNCIATION*).
  The same information can also be retrieved via the ECAM STATUS page.
- NAV ALL SPD UNCERTAIN
  The NAV ALL SPD UNCERTAIN alert appears when all speed sources are declared UNCERTAIN or FAULT.
  The associated procedure of NAV ALL SPD UNCERTAIN requests the flight crew to apply the Unreliable Speed Indication procedure (*Refer to PRO-ABN-NAV UNRELIABLE SPEED INDICATION - Memory Items*).

The following ECAM alerts are also introduced with the speed monitoring function:

- NAV BKUP SPD FAULT
  L2 *Refer to PRO-ABN-NAV NAV BKUP SPD FAULT - ANNUNCIATION*
- L1 NAV BKUP SPD UNCERTAIN
  L2 *Refer to PRO-ABN-NAV NAV BKUP SPD UNCERTAIN - ANNUNCIATION*
- L1 NAV ADR ALT DISAGREE.
  L2 *Refer to PRO-ABN-NAV NAV ADR ALT DISAGREE - ANNUNCIATION*

Ident.: DSC-34-NAV-10-30-20-A-00023359.0001001 / 03 NOV 21

3

NAV AIR SPD STS CHANGED and NAV ALL SPD UNCERTAIN appear with one or several of the below messages:

ADR 1(2)(3) SPD RELIABLE	Appears when ADR 1(2)(3) airspeed is valid and consistent with other reliable speed sources.
BKUP SPD RELIABLE	Appears when Backup Speed is consistent with other reliable speed sources (if any), or is the only reliable speed source.

ADR 1(2)(3) SPD FAULT	: Appears when: - ADR 1(2)(3) speed is not consistent with other reliable speed sources and when backup speed is reliable, or - Icing conditions are detected on associated pitot probe and backup speed is reliable. *Note: If the backup speed is considered not reliable, the ADR speed is declared UNCERTAIN instead of FAULT.*
ADR 1(2)(3) SPD UNCERTAIN	Appears when ADR 1(2)(3) speed is not consistent with other reliable speed sources and backup speed is fault or uncertain (BKUP SPD UNCERTAIN or BKUP SPD FAULT).
BKUP SPD FAULT	Appears when the backup speed is lost (*Refer to PRO-ABN-NAV NAV BKUP SPD FAULT - ANNUNCIATION*).
BKUP SPD UNCERTAIN	Appears when the backup speed is not consistent with reliable airspeed sources.
STBY SPD UNCERTAIN	Appears when ADR 3 speed is declared FAULT. *Note: The STBY SPD UNCERTAIN status is displayed only when ADR 3 airspeed is faulty for flight crew to be aware that the same pitot probe is used to compute ADR 3 airspeed and standby airspeed. Standby airspeed will not appear as RELIABLE or FAULT.*

When all speeds are recovered as reliable, the NAV AIR SPD STS CHANGED is recalled.
When a speed is declared FAULT, it is flagged on the PFDs/ HUDs ◁ (SPD flag, *Refer to DSC-31-40 Flags and Messages Displayed on PFD - Schematic*).
When a speed is declared UNCERTAIN, it is not flagged on the PFDs/ HUDs ◁ .

DIGITAL BACKUP SPEED/ALTITUDE

Applicable to: MSN 10949-11597

Ident.: DSC-34-NAV-10-30-20-B-00023371.0001001 / 21 JAN 21

4

GENERAL

The DBUS enables the flight crew to fly the aircraft with the backup speed and backup altitude displayed on PFD.

The following ECAM alerts request that the flight crew to activate the DBUS when it is reliable and when at least two ADRs are confirmed unreliable:

- NAV ADR SPD STS CHANGED
- NAV ADR 1(2)(3) FAULT
- NAV ADR 1+2(1+3)(2+3) FAULT
- NAV ADR 1+2+3 FAULT.

When the DBUS is activated:

- The backup speed appears on the PFD/ HUD ◁ instead of the normal airspeed.
- The GPS altitude appears on the PFD/ HUD ◁ instead of the barometric altitude.

The use of the DBUS is reversible.

The flight crew can activate and deactivate the DBUS with two BKUP SPD/ALT pushbuttons available on the main instrument panel:

- One on the left of the Captain PFD
- One on the right of the F/O PFD.

Each BKUP SPD/ALT pb independently commands the display of the DBUS on its associated side on the PFD and HUD ◁ .

BKUP SPD/ALT PB

BKUP
SPD/ALT
ON

DBUS does not appear on the associated PFD and HUD ◁ .
When pressed, the DBUS appears on the associated PFD and HUD ◁ .

BKUP
SPD/ALT
ON

DBUS appears on the associated PFD and HUD ◁ .
When pressed, the DBUS no longer appears on the associated PFD and HUD ◁ .

ASSOCIATED ECAM ALERT

The ECAM displays an alert when the flight crew presses the BKUP SPD/ALT pb to activate the DBUS:

- On the CAPT(F/O) side with the AP 1(2) and/or FD 1(2) engaged, or
  L2 *Refer to PRO-ABN-NAV NAV BKUP SPD/ALT ON CAPT(F/O) PFD*
- L1 On both sides with at least one reliable ADR speed available.
  L2 *Refer to PRO-ABN-NAV NAV BKUP SPD/ALT ON CAPT+F/O PFD*.

L1 The ECAM displays NAV BKUP SPD FAULT when the DBUS is failed. *Refer to PRO-ABN-NAV NAV BKUP SPD FAULT - ANNUNCIATION*.

ASSOCIATED MEMO

BKUP SPD/ALT : This memo appears when the flight crew activates the DBUS on at least one side.

BKUP SPD/ALT : This memo appears in the case of a configuration that is not correct:
- The DBUS is FAULT or UNCERTAIN, or
- The DBUS is selected on the side where the AP is engaged, or
- The DBUS is selected on both PFDs while at least one ADR is reliable

Ident.: DSC-34-NAV-10-30-20-B-00023373.0001001 / 21 JAN 21

5

DIGITAL BACKUP SPEED

DBUS activation on the PFD is indicated by:
- BKUP SPD and GPS ALT labels
- Amber double dash over the last digit of speed and mach
- Amber double dash over the last two digits of altitude.

When at least one ADR is valid, the computation of the characteristic speeds is based on this valid ADR source.
When all ADR becomes invalid, the characteristic speeds are computed based on the backup speed / mach and GPIRS altitude.

UNDUE INHIBITION OF NAV BKUP SPD/ALT ON CAPT (F/O) PFD

Ident.: DSC-34-NAV-10-40-00024631.0003001 / 10 DEC 20
Applicable to: MSN 08635

DESCRIPTION

The following alerts with their associated procedures are unduly inhibited when the BUSS is activated on only one side (CAPT or F/O), while AP and/or FD are engaged on the same side:

- NAV BKUP SPD/ALT ON CAPT PFD
- NAV BKUP SPD/ALT ON F/O PFD

The procedures associated with these alerts request to switch AP and FD on the other side. In addition, a BKUP SPD/ALT memo is displayed on EWD. This memo is not affected by this abnormal behavior and will still appear on EWD.

OPERATIONAL RECOMMENDATIONS

If the flight crew activates the BUSS on one PFD, do not use AP or FD on the side the BUSS is activated.

Intentionally left blank

DESCRIPTION

Ident.: DSC-34-NAV-15-10-00018530.0001001 / 21 MAR 16
Applicable to: ALL

The Global Positioning System (GPS) is a satellite-based radio navigation aid.
Worldwide, 24 satellites broadcast accurate navigation data that the aircraft use for precise determination of its position.

The aircraft has two independent GPS receivers. Depending of the aircraft configuration, each receiver consists:
- Of a GPS Sensor Unit (GPSSU), or
- Is integrated in the Multi Mode Receiver (MMR). The GPS1 receiver in MMR1, and the GPS2 receiver in MMR2.

The GPSSU or the MMR processes the received data, and transfers them to the ADIRUs. Then each ADIRU performs the GP-IRS hybrid position calculation. FMGCs use this hybrid position.

ADIRU3
ADIRU2

OPERATIONS

GPS information are available on the FMS – GPS Monitor Page. *Refer to DSC-22_20-50-10 Pages descriptions*.

- During normal operations
  The GPS receiver 1 supplies the ADIRU 1 and the ADIRU 3, and the GPS receiver 2 supplies the ADIRU 2.
- In case of failure of one GPS receiver
  All ADIRUs use the operative GPS receiver.
- In case of failure of ADIRUs
  - If the ADIRU 1 fails, ADIRU 3 is supplied by the GPS receiver 1, and ADIRU 2 is supplied by the GPS receiver 2.
  - If the ADIRU 2 fails, the ATT HDG selector has to be set to F/O 3 in order to maintain Side 1 and Side 2 segregation. In this case, the ADIRU 3 will be supplied with GPS receiver 2.
  - If two ADIRUs fail, the remaining ADIRU is supplied by its own side GPS receiver.

(1) Fixed aircraft symbol
The fixed aircraft symbol is in black, and outlined in yellow.
Depending of the aircraft configuration, the center of the fixed aircraft symbol is a point (like on the illustration above) or “V-bars”.

(2) Roll scale
The roll scale is in white.
The markers are at 0 (small yellow triangle), 10, 20, 30, 45, 60 ° of bank.

(3) Roll index
The roll index is in black, and outlined in white. It indicates the bank angle.

(4) Lateral acceleration index
The trapezoidal index moves beneath the roll index. It represents the aircraft’s lateral acceleration.

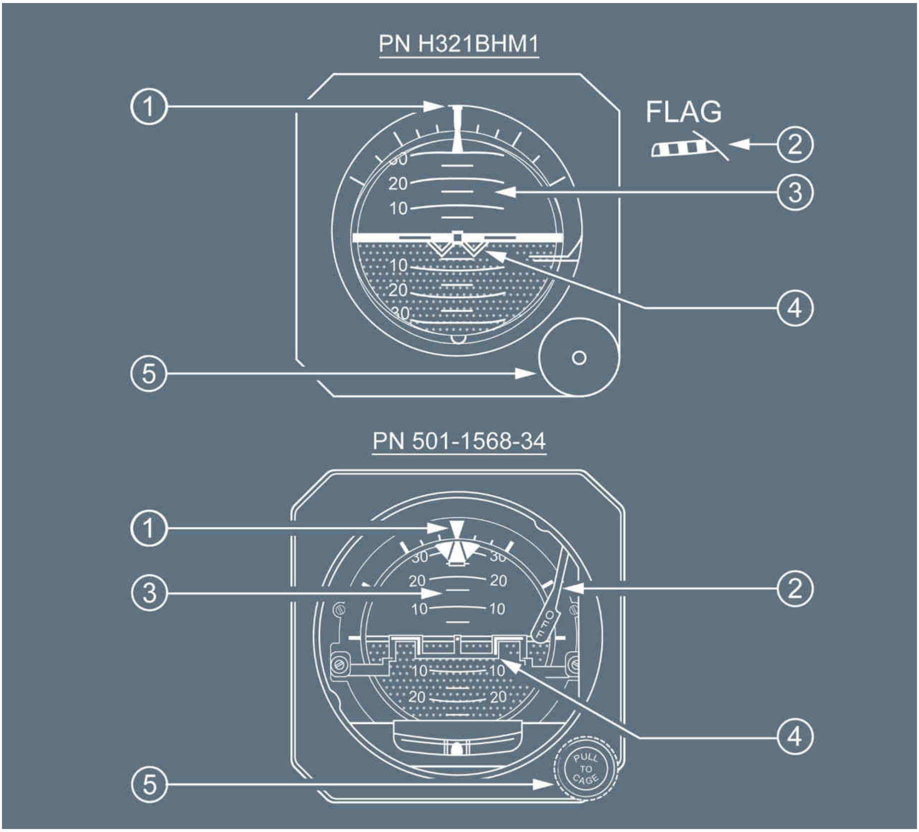
(5) Pitch scale
The pitch scale is in white. The scale shows markers every 2.5 ° between 30 ° nose up and 30 ° nose down. Beyond 30 °, large red arrowheads (V-shaped) indicate that the attitude has become excessive, and show the direction to follow in order to reduce it. The minimum pitch scale displayed is -17.5 ° +15 ° at 0 ° pitch.

(6) ATT RST
The attitude indication can be reset by pressing this pushbutton for at least 2 s. The aircraft must be level during this procedure. During the reset time (approximately 10 s), the “ATT 10 s” message is displayed on the screen. This pushbutton is also used to realign the system, if excessive aircraft movement is detected during the alignment phase.

ATTITUDE

Ident.: DSC-34-NAV-20-00018575.0001001 / 19 SEP 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321

Note: *When leveling the wings, after performing a small turn of a small bank angle, the displayed roll attitude may temporarily be incorrect by a few degrees.*



(1) Roll scale
The roll scale indicates the bank angle. It has bank angle graduations up to 60 °. There is no rotation limit.

(2) Flag
The flag appears if the instrument fails or if power supply fails.

(3) Pitch scale
The pitch scale indicates the pitch attitude. The Standby Horizon PN H321BHM1 can show pitch angle up to ± 85 °. The Standby Horizon PN 501-1568-34 can show pitch angle up to ± 90 °.

(4) Aircraft reference
Fixed symbol.

(5) Caging knob
The flight crew pulls it out to reinitialize the gyro, and to level and center the horizon. (The airplane should be level during this procedure).

Note: *After low-rate turns, the standby horizon may not give accurate indications. To correct this behavior, use the caging knob when the aircraft is level.*

AIRSPEED

Ident.: DSC-34-NAV-20-00018576.0002001 / 21 MAR 16

(1) Altitude indication

The altitude indication is given as a white moving scale, and a green digital readout on a gray background.
The altitude scale ranges from -2 000 to 50 000 ft every 100 ft, with altitude digital indications every 500 ft.
For negative altitudes, "NEG" appears in the window in white.
The altitude box changes to cyan, when it also corresponds to a bug value.
Depending of the aircraft configuration, the altitude in meters is displayed above the altitude scale.

(2) Barometric reference

The barometric reference pressure is displayed in cyan.

The displayed barometric reference is:
- The standard barometric reference "STD", or
- Depending of the aircraft configuration, the barometric pressure is "hPa" or "hPa/ inHg".

(3) Barometric selection knob

This knob enables the selection of a barometric pressure, setting a variation of 10 hPa per knob rotation.
The standard barometric pressure can be selected by pressing the barometric knob. “STD” is then displayed, in place of the pressure value.
Pressing the knob again will display the selected barometric pressure.

(4) Altitude bug
When an altitude bug is entered through the bugs function, the corresponding altitude mark is indicated by a cyan dash, or by a cyan box when the dash covers the digital indication on the scale.

Localizer (or F-LOC ◁)
Scale and Index

LOCALIZER / SCALE AND INDEX

Localizer / scale and index.

GLIDESLOPE / SCALE AND INDEX

When the LS pb is pressed, the deviation scales are displayed.
When deviation scales are displayed and the LS deviations are valid, the indexes appear.

The LS deviations that are displayed correspond to the LS approach:
- Selected on the MCDU, or
- Tuned on the RMP.

Note: *The LS approach corresponds to approach using either ILS, MLS ◁ , GLS ◁ , SLS ◁ , or non precision approach using FLS ◁ .*

LS SELECTION PUSHBUTTON

Pressing the LS pb will display the LS scales. Pressing the LS pb again will remove the LS scales.

CAUTION Do not use the ISIS LS for takeoff using the localizer of the opposite runway, or for a back-course localizer approach. The LOC deviations are given in the wrong sense.

BUGS FUNCTION

Ident.: DSC-34-NAV-20-00018578.0001001 / 21 MAR 16

6 **Applicable to: MSN 02014, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

SPD BUG AND ALT BUG COLUMNS
BOX ACTIVATION PUSHBUTTONS
4
3
BUGS VALUE SELECTION KNOB

(1) BUGS function selection pushbutton
Pressing the BUGS pushbutton will activate the BUGS function and display the bug values to be selected.

(2) SPD BUG and ALT BUG columns
The SPD BUG column gives four speed values (in knots) that can be selected by the crew.
The ALT BUG column gives two altitude values (feet) to be selected by the crew.

(3) BUGS value selection knob
It allows the bug value to be set by rotating the BARO knob. This value cannot be lower than 30 kt for a speed bug, or a negative value for an altitude bug.
Pressing the BARO setting knob, once a bug value box is activated, will deselect the bug value. The “OFF” label comes on close to the activated box.
The entered values are memorized by the system, when exiting the screen, by pressing the BUGS pushbutton (1), or after 15 s without any pilot action.

(4) “+”/”-” box activation buttons
Access from one box to another is obtained by pressing the “+” or “–” pushbutton.
When a bug value is entered, access to the next box is obtained by pressing the “–” pushbutton. The box becomes active and flashes.

The “+” pushbutton can be used to return to a previous box.

Note: *Use of the ISIS bugs function is not recommended because, in the event that both PFDs are lost in flight, when the ISIS bugs were previously set for takeoff, then for the approach, the bugs would remain at the takeoff characteristic speed settings.*

FLAGS

Ident.: DSC-34-NAV-20-00018580.0002001 / 21 MAR 16

7 **Applicable to: MSN 02014, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

(1) ATT flag (red)
When attitude data is lost, the red ATT flag appears.

(2) SPD flag (red)
When airspeed data is lost, the red SPD flag appears.

(3) M flag (red)
When mach number is lost, the red M flag appears.

(4) ALT flag (red)
When altitude data is lost, the red ALT flag appears.

(5) G/S flag (red)
When glideslope information is lost, the red G/S flag appears.

(6) LOC flag (red)
When localizer data is lost, the red LOC flag appears.

(7) ATT: RST (yellow)

The "ATT: RST" flag appears:
- When excessive aircraft movement is detected during the alignment phase, or
- After 350 h of continuous electrical supply, or
- When the "WAIT ATT" flag is displayed during more than 10 s.

In both cases, press the ATT RST pb to reset/realign and recover the attitude indication.

(8) MAINT flag (white)
Maintenance required. This "MAINT flag" does not affect ISIS operation.
Displayed only on ground phase (speed < 60 kt).

(9) OUT OF ORDER (white)
When an internal failure of the ISIS indicator occurs, the "OUT OF ORDER" message appears, accompanied by a fault code.

(10) WAIT ATT flag (yellow)

If the ISIS looses attitude data, its entire sphere is cleared to display the: "WAIT ATT" flag.
- If the "WAIT ATT" flag is displayed during less than 10 s, a normal operation is recovered.
- If attitude data are lost for more than 10 s, the "WAIT ATT" flag is then replaced by the "ATT: RST" flag.

(11) ATT 10 s flag (yellow)
This count down flag appears, when the flight crew press the ATT RST pb, in order to indicate that the attitude reset function is in progress.

GENERAL

Ident.: DSC-34-NAV-30-10-00018581.0001001 / 21 MAR 16
Applicable to: ALL

Three modes of tuning are available.

1. **Automatic Tuning**

   This is the basic means for tuning navaids.
   In normal operation, the FMGC tunes navaids automatically, with each FMGC controlling its own receivers.
   If one FMGC fails, the remaining FMGC controls both sides receivers.

2. **Manual Tuning**

   The flight crew can use the MCDU to override the automatic tuning of navaids by FMGC in order to select a specific navaid for visual display.
   This does not affect the automatic function of the FMGC.
   Any entry on one MCDU is sent to both FMGC in dual mode, or the remaining FMGC in single mode.

3. **Back Up Tuning**

   If both FMGCs fail, the flight crew can use the RMPs (Radio Management Panels 1 and 2) on the pedestal for back up tuning.
   The CAPT RMP controls VOR1 and ADF 1 ◁ .
   The F/O RMP controls VOR2 and ADF 2 ◁ .
   Either RMP controls ILS/GLS ◁ / MLS ◁ , provided “STBY NAV” is selected on RMP1 and RMP2. RMP3 ◁ is not used for navaids tuning.

VOR

1 Ident.: DSC-34-NAV-30-20-00018657.0002001 / 28 SEP 18
Applicable to: MSN 11522-11597

The aircraft has two Multi Mode Receivers (MMRs) with VOR capability.

- The Navigation Displays (NDs) display VOR 1 and VOR 2 information, in accordance with the position of the ADF ◁ / VOR selectors on the EFIS control panel (*Refer to DSC-31-45 ROSE Modes*).
- The DDRMI ◁ also displays VOR 1 and VOR 2 bearings, if the heading signal is valid.

VOR

Ident.: DSC-34-NAV-30-20-00018657.0001001 / 21 MAR 16
2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11482**

The aircraft has two VOR receivers.

- The Navigation Displays (NDs) display VOR1 and VOR2 information, in accordance with the position of the ADF ◁ /VOR selectors on the EFIS control panel (*Refer to DSC-31-45 ROSE Modes*).
- The DDRMI ◁ also displays VOR1 and VOR2 bearings, if the heading signal is valid.

ILS/GLS ◁ /MLS ◁

Ident.: DSC-34-NAV-30-20-00018658.0001001 / 29 MAY 20
Applicable to: ALL

The aircraft has two ILS/ GLS ◁ /MLS ◁ receivers.

Note: *When the aircraft is equipped with MMRs, ILS and GLS ◁ and MLS ◁ receivers are in the MMRs (ILS1/ GLS1 ◁ / MLS1 ◁ in the MMR1 and the ILS2/ GLS2 ◁ / MLS2 ◁ in the MMR2)*

- PFD1 and ND2 display ILS1/ GLS1 ◁ / MLS1 ◁ information.
- PFD2 and ND1 display ILS2/ GLS2 ◁ / MLS2 ◁ information.
- The PFD display the ILS/GLS ◁ / MLS ◁ information if the flight crew press the LS pb or ILS pb (depending of the aircraft configuration) on the EFIS control panel (*Refer to DSC-31-50 EFIS Control Panel*).
- The NDs display the ILS/GLS ◁ /MLS ◁ information if the flight crew selects the ROSE LS mode or the ROSE ILS mode (depending of the aircraft configuration) on the EFIS control panel (*Refer to DSC-31-50 EFIS Control Panel*).

ADF ⊲

Ident.: DSC-34-NAV-30-20-00018659.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft may be fitted with 1 ADF ⊲ or 2 ADF ⊲ .
The NDs display ADF ⊲ information, depending on the position of the ADF/VOR selectors on the EFIS control panel (*Refer to DSC-31-45 ROSE Modes*).
The DDRMI ⊲ also displays ADF 1 ⊲ and ADF 2 ⊲ bearings, depending on the position of the ADF/VOR selector on the DDRMI ⊲ .

DME

Ident.: DSC-34-NAV-30-20-00018660.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft has two DMEs.
The frequency that is automatically set on the DME corresponds to the frequency/channel that is set on the VOR, or ILS, or GLS ⊲ , or MLS ⊲ .
The NDs and the DDRMI ⊲ can display DME information associated with VOR.
The PFDs can display DME information associated with ILS/ GLS ⊲ / MLS ⊲ (*Refer to DSC-31-40 Trajectory Deviation - ILS Approach*).

MARKER BEACON

3 Ident.: DSC-34-NAV-30-20-00001389.0002001 / 28 SEP 18
Applicable to: MSN 11522-11597

One marker beacon system is included in MMR 1.
The PFD displays the outer, middle, and inner marker signals (*Refer to DSC-31-40 Trajectory Deviation - ILS Approach*).

MARKER BEACON

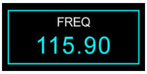
ADF FREQUENCY



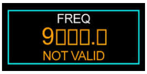
The flight crew presses the RMP L1 (L2) key and selects the ADF frequency for modification.

The current ADF frequency is validated and deselected when one of the following occurs:
- The flight crew presses again on the related RMP key, or
- The flight crew selects another ADF frequency, or
- Automatically when the frequency is complete and valid.

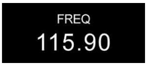
When the ADF frequency is validated and deselected, the associated BFO Mode is then set to off.
When the flight crew enters a frequency, the system does not complete the frequency. Amber boxes are displayed in place of not yet entered digits.

If at validation, the ADF frequency is not complete, all of the following occur:
- The current ADF frequency remains selected
- The ADF1(2) FREQ NOT COMPLETE RMP message is also displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).

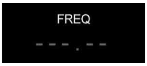
The flight crew can clear a digit, via the CLR key.
The flight crew can press and maintain the CLR key, in order to remove all the entered digits and display the previous valid ADF frequency.



The modified ADF frequency is not a standard ADF frequency. The flight crew can clear the erroneous digits, via the CLR key, until the ADF frequency displays in cyan again.



The ADF frequency is not selected for modification. The flight crew can press the related RMP (L1 or L2) key to select it.



The RMPs are not synchronized, or an internal failure has occurred.

ADF IDENTIFIER

The ADF 1(2) receiver is in reception mode.

The ADF 1(2) receiver is not in reception mode.

BFO MODE

The flight crew uses the RMP L1 or L2 key to modify the BFO Mode, whatever the current selected BFO.

	When there is no display, indicates that no NAV receiver is selected for reception.
BFO MODE OFF **ON**	The BFO Mode is on.
BFO MODE **OFF** ON	The BFO Mode is off.
BFO MODE OFF ON	The RMPs are not synchronized, or an internal failure has occurred.

MESSAGE AREA

Refer to DSC-23-45-20 RMP Messages on the RMP Message Area.

RETURN

RETURN	Displays the NAV page (*Refer to DSC-34-NAV-30-30 NAV Page*).

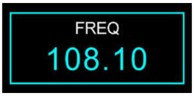
FREQUENCY / CHANNEL



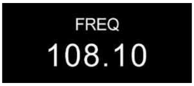
The flight crew presses the RMP L1 (L2 or L3) key and selects the ILS frequency (GLS channel or MLS channel) for modification.

The current ILS frequency (GLS channel or MLS channel) is validated and deselected when one of the following occurs:
- The flight crew presses again on the related RMP key, or
- The flight crew selects the related CRS through RMP R1 (R2 or R3) key, or
- The flight crew selects the GLS or MLS (or ILS) info through RMP R2 or R3 (or R1) key, or
- Automatically, when the frequency (channel) is complete and valid.

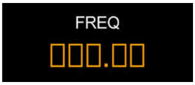
When the flight crew enters a frequency (channel), the system does not complete the frequency (channel). Amber boxes are displayed in place of not yet entered digits.

If at validation, the ILS frequency (GLS channel or MLS channel) is not complete, all of the following occur:
- The current ILS frequency (GLS channel or MLS channel) remains selected
- The ILS FREQ NOT COMPLETE RMP message (GLS FREQ NOT COMPLETE (GLS) or MLS FREQ NOT COMPLETE (MLS)) is also displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).

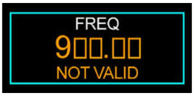
The flight crew can clear a digit, via the CLR key.
The flight crew can press and maintain the CLR key, in order to remove all the entered digits and display the previous valid ILS frequency (GLS channel / MLS channel).



The ILS frequency (GLS channel / MLS channel) is not selected for modification. The flight crew can press the related RMP L1 (L2 or L3) key to select it for modification.



No ILS frequency (GLS channel / MLS channel) is active.



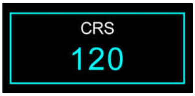
The modified ILS frequency (GLS channel / MLS channel) is not a standard ILS frequency (GLS channel / MLS). The flight crew can clear the erroneous digits, via the CLR key, until the ILS frequency (GLS channel / MLS channel) displays in cyan again.

	The RMPs are not synchronized, or an internal failure has occurred.

RADIO DATA

	The ILS frequency (GLS ◁ channel / MLS ◁ channel) is active.
	The ILS frequency (GLS ◁ / MLS ◁) is active, and the ILS receiver is in reception mode.
	No ILS frequency (GLS ◁ channel / MLS ◁ channel) is active.
	No ILS frequency (GLS ◁ channel / MLS ◁ channel) is active, and the ILS (GLS ◁ / MLS ◁) receiver is in reception mode.

COURSE



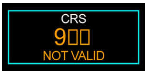
The flight crew pressed the RMP R1 (R2 or R3) key and selects the ILS (GLS ◁ / MLS ◁) course for modification.
The course value range varies from 0 (displayed as "000") to 360 degrees. If the flight crew enters the value "360", the ILS (GLS ◁ / MLS ◁) course displays the value "000" after validation.

The current ILS (GLS ◁ / MLS ◁) course is validated and deselected, when one of the following occurs:
- The flight crew presses again on the related RMP key, or
- The flight crew selects the related ILS frequency (GLS ◁ channel / MLS ◁ channel) through RMP L1 (L2 or L3) key, or
- The flight crew selects the GLS ◁ or MLS ◁ (or ILS) info through the RMP R2 or R3 (or R1) key,or
- Automatically when the course is complete and valid.

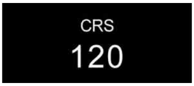
When the flight crew enters a course, the system does not complete the course. Amber boxes are displayed in place of not yet entered digits.

If at validation, the course is not complete, all of the following occur:
- The current ILS (GLS ◁ or MLS ◁) course remains selected
- The ILS CRS NOT COMPLETE RMP message (GLS CRS NOT COMPLETE (GLS ◁) or MLS CRS NOT COMPLETE (MLS ◁)) is also displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).

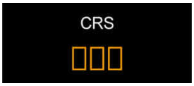
The flight crew can clear a digit, via the CLR key.
The flight crew can press and maintain the CLR key, in order to remove all the entered digits and display the previous valid ILS (GLS ◁ / MLS ◁) course.



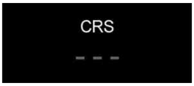
The modified ILS (GLS ◁ / MLS ◁) course is not a standard ILS (GLS ◁ / MLS ◁) course. The flight crew can clear the erroneous digits, via the CLR key, until the ILS (GLS ◁ / MLS ◁) course displays in cyan again.



The ILS (GLS ◁ / MLS ◁) course is not selected for modification. The flight crew can press the related RMP key to select it.



No ILS frequency (GLS ◁ / MLS ◁) is active.



The RMPs are not synchronized, or an internal failure has occurred.

MESSAGE AREA

Refer to DSC-23-45-20 RMP Messages on the RMP Message Area.

RETURN

Displays the NAV page (*Refer to DSC-34-NAV-30-30 NAV Page*).

NAV PAGE ACCESS KEY

The flight crew can display this page by pressing the NAV access key on the RMP (*Refer to DSC-23-45-10 RMP External Communication*).

RADIO NAVIGATION STATUS

AUTO STBY NAV	The FMS tunes the navaids. The RMP is only used to control the communication. The flight crew can press the RMP L2 key to change the navaid manual selection from the FMS to the RMP.

AUTO STBY NAV	The RMP tunes the navaids. The RMP operates in STBY NAV mode, and still controls the communication. The flight crew can press the RMP L2 key to change the navaid manual selection from the RMP to the FMS.

Note:
- *The flight crew must select this backup tuning mode on both RMP 1 and RMP 2, if both FMGCs or both MCDUs fail. In the emergency electrical configuration, RMP 1 and RMP 2 receive power.*
- *On RMP 3, the tuning of LS, VOR, ADF ◁ is not available.*
- *In the STBY NAV mode, the flight crew can select radio communication systems as it would in the normal mode.*

VOICE MODE

	When there is no display, indicates that no NAV receiver is selected for reception.
VOICE ON OFF	The reception of the audio identification signal is inhibited. When the RMP L4 key is pressed, the flight crew turns on the VOICE mode of the selected NAV receiver, and enables the reception of the audio identification signal.
VOICE ON OFF	The reception of the audio identification signal is active. When the RMP L4 key is pressed, the flight crew turns off the VOICE mode of the selected NAV receiver, and inhibits the reception of the audio identification signal.

LS KEY

Displays the LS page when the RMP R1 key is pressed (*Refer to DSC-34-NAV-30-30 LS Page*).

VOR KEY

Displays the VOR page when the RMP R2 key is pressed (*Refer to DSC-34-NAV-30-30 VOR Page*).

ADF ◁ KEY

Displays the ADF page (ADF ◁) when the RMP R3 key is pressed (*Refer to DSC-34-NAV-30-30 ADF (If Installed) Page*).

AUDIO NAVIGATION

The flight crew can press the RMP R4 key to select a NAV receiver. Each time the RMP R4 key is pressed, this activates the next NAV receiver from the list.
The list of NAV receiver is updated according to the installed systems on A/C.

🔈 AUDIO NAV	The selected NAV receiver is activated in reception mode.

LS	The LS (MKR , VOR1, VOR2, ADF1 ◁ , ADF2 ◁) NAV receiver is not selected.
LS	The LS (MKR, VOR1, VOR2, ADF1 ◁ , ADF2 ◁) NAV receiver is selected. The flight crew presses the NAV reception knob in order to receive the audio of the NAV receiver.

NAV RECEPTION KNOB

The flight crew uses the NAV reception knob to:
- Enable the audio reception of the NAV receiver
- Adjust the volume of the NAV reception.

	The associated NAV receiver is not in audio reception mode. When pressed and released in the out position, the reception knob turns on the audio reception mode.
	The associated NAV receiver is in audio reception mode. When turned, the reception knob adjusts the volume of the headsets and the loudspeakers. When pressed and released in the in position, the reception knob turns off the audio reception mode.

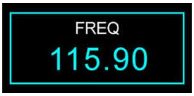
VOR FREQUENCY



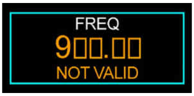
The flight crew presses the RMP L1(L2) key and selects the VOR frequency for modification.

The current VOR frequency is validated and deselected when one of the following occurs:
- The flight crew presses again on the related RMP key, or
- The flight crew selects another VOR frequency / VOR course, or
- Automatically when the frequency is complete and valid.

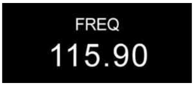
When the flight crew enters a frequency, the system does not complete the frequency. Amber boxes are displayed in place of not yet entered digits.

If at validation, the VOR frequency is not complete, all of the following occur:
- The current VOR frequency remains selected
- The VOR 1(2) FREQ NOT COMPLETE RMP message is also displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).

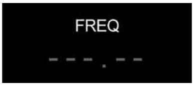
The flight crew can clear a digit, via the CLR key.
The flight crew can press and maintain the CLR key , in order to remove all the entered digits and display the previous valid VOR Frequency.



The modified VOR frequency is not a standard VOR frequency. The flight crew can clear the erroneous digits, via the CLR key, until the VOR frequency displays in cyan again.



The VOR frequency is not selected for modification. The flight crew can press the related RMP (L1 or L2) key to select it



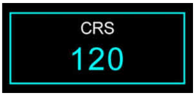
The RMPs are not synchronized, or an internal failure has occurred.

VOR IDENTIFIER

The VOR 1(2) receiver is in reception mode.

The VOR 1(2) receiver is not in reception mode.

VOR COURSE



CRS
120

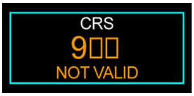
The flight crew pressed the RMP R1(R2) key and selects the VOR ccourse for modification.
The course value range varies from 0 (displays as "000") to 360 degrees.
If the flight crew enters the value "360", the VOR course displays the value "000" after validation.

The current VOR course is validated and deselected when one of the following occurs:
- The flight crew presses again on the related RMP key, or
- The flight crew selects another VOR frequency / VOR course, or
- Automatically when the frequency is complete and valid.

When the flight crew enters a course, the system does not complete the course. Amber boxes are displayed in place of not yet entered digits.

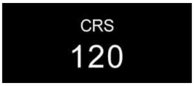
If at validation, the VOR course is not complete, all of the following occur:
- The current VOR course remains selected
- The VOR 1(2) CRS NOT COMPLETE RMP message is also displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).

The flight crew can clear a digit, via the CLR key.
The flight crew can press and maintain the CLR key, in order to remove all the entered digits and display the previous valid VOR course.



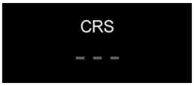
CRS
9☐☐
NOT VALID

The modified VOR course is not a standard VOR course. The flight crew can clear the erroneous digits, via the CLR key, until the VOR course displays in cyan again.



CRS
120

The VOR course is not selected for modification. The flight crew can press the related RMP (R1 or R2) key to select it.



CRS
- - -

The RMPs are not synchronized, or an internal failure has occurred.

MESSAGE AREA

Refer to DSC-23-45-20 RMP Messages on the RMP Message Area.

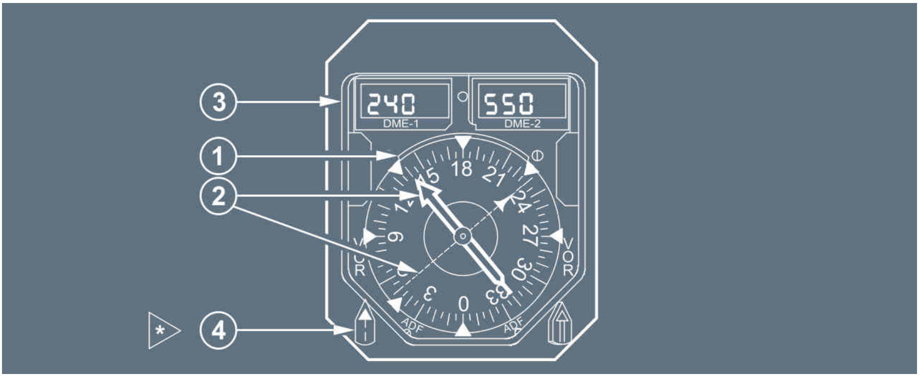
RETURN

RETURN

Displays the NAV page (*Refer to DSC-34-NAV-30-30 NAV Page*).

DIGITAL DISTANCE AND RADIO MAGNETIC INDICATOR ◁ (DDRMI)

Ident.: DSC-34-NAV-30-30-00018583.0001001 / 21 MAR 16
Applicable to: ALL



(1) Compass card
ADIRU1 normally supplies the signal that positions the compass card.
ADIRU3 supplies this signal when selected by the ATT HDG SWITCHING selector.

(2) Bearings pointers
Indicate the magnetic bearing to the station received by VOR1 or ADF 1 ◁ (dashed pointer) and VOR2 or ADF 2 ◁ (double pointer).

Note: Depending on the quality of the VOR beacon's signal, and mainly at distances greater than 25 NM from the station, the processing of the signal, on aircraft equipped with COLLINS or BENDIX VOR may lead to bearing pointer oscillations.

(3) DME1(2) counters
Indicates distance in nautical miles to/from DME station.

The counters indicate distances:
- in NM when the station is at more than 20 NM
- 1/10th of NM when the station is at less than 20 NM.

When the station is at less than 1 NM, 0 is shown.
The DME1 and DME2 display are blanked or dashed when a fault is detected or data invalid.

(4) VOR/ADF selector

- VOR1 or ADF 1 on the dashed pointer.
- VOR2 or ADF 2 on the double pointer (if ADF2 is not installed, then ADF1 may be selected).

The DDRMI has also VOR/ADF flags and HDG flags when the associated information is not available.

The indicators display these flags if:
- The VOR or ADF receiver fails (associated to the VOR/ADF flag only)
- The DDRMI has an internal failure
- The heading signal from ADIRS is not valid
- The power supply fails.

As long as the VOR/ADF flag is shown, and depending of the aircraft configuration, the associated bearing pointer remains:
- At the last valid position, or
- Into the horizontal line.

RADIO MANAGEMENT PANEL (RMP)

2 RADIO NAVIGATION BACK-UP MODE KEY
3 RADIO NAVIGATION SELECTION KEYS
9 * BFO KEY
1 RMP ON/OFF CONTROL

(1) ON/OFF sw
This switch controls the power supply to the panel.

(2) NAV key (transparent switchguard)

- Pressing this key engages the radio navigation backup mode. It takes control of the VOR, ILS, GLS ◁ , MLS ◁ and ADF ◁ receivers away from the FMGC and gives it to the RMP.
- The green monitor light comes on.
- Pressing the NAV key a second time returns control of the navigation radios to the FMGC.

Note:
- *The flight crew must select this backup tuning mode on both RMP1 and RMP2 if both FMGCs or both MCDUs fail. In the emergency electrical configuration, only RMP1 receives power*
- *Pressing the NAV key on RMP3 ◁ has no effect*
- *In the NAV backup mode, the flight crew can select radio communication systems as it would in the normal mode.*
  Setting one RMP to NAV backup mode removes navaids tuning from both FMGCs.
- *When the flight crew uses an RMP to tune an ILS/DME or GLS ◁ /DME or MLS ◁ /DME, the PFDs do not display the DME distance.*

(3) STBY NAV keys

When the NAV key is on and the flight crew presses one of these STBY NAV keys, the ACTIVE window displays the frequency/channel to which that receiver is tuned. The green monitor light on the selected key comes on, and the one on the previously selected STBY NAV or COM key goes out.

(4) Frequency/channel selector knob

Two concentric knobs allow the flight crew to preselect frequencies/channels for communication radios and stand-by navigation systems and select courses for VOR, ILS, GLS ◁ and MLS ◁ .
The desired frequency, channel or course is set in the STBY/CRS window.
The outer and the inner knobs set a frequency/channel: the outer knob controls the most significant digits, the inner knob controls the least significant digits. A rate multiplier speeds up the tuning when the knob is rotated quickly.
The inner knob only sets a course.

(5) Transfer key

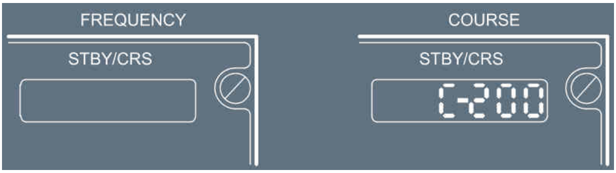
The flight crew presses this key to interchange ACTIVE and STBY frequencies/channels. This action tunes the selected receiver to the new ACTIVE frequency/channel.

(6) STBY/CRS window

The flight crew can make the displayed frequency /channel by rotating the tuning knob.

The frequency/channel displayed in the window becomes the active frequency/channel when the flight crew presses the Transfer Key.
If this window displays a course, then the ACTIVE window displays the associated frequency/channel.

Note: *If the STBY/CRS window is displaying a course, then pressing the transfer key displays the active frequency/channel in both windows.*



(7) ACTIVE window
This window displays the frequency/channel of the selected navaid, which is identified by a green monitor light on the selection key.

(8) LOAD FUNCTION ◁
The flight crew can load the VHF frequency from the CPDLC CONTACT/MONITOR messages to the STBY/CRS window.

(9) BFO key ◁
If the ADF ◁ is selected, pressing this key activates the BFO (Beat Frequency Oscillator). For most ADF, with BFO activated, the audio identification is heard. However there are some ADF where the BFO must be deactivated in order to hear the audio identification.

Intentionally left blank

GENERAL

Ident.: DSC-34-NAV-40-10-00018585.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft has two radio altimeters (RA).
CAPT PFD displays the RA1 height, and the F/Os PFD displays the RA2 height.
If one RA fails, both PFDs display the height from the remaining RA.
For indication on the PFD, *Refer to DSC-31-40 Altitude (CONT'D)*.

AUTOMATIC CALLOUT

Ident.: DSC-34-NAV-40-10-00018656.0001001 / 21 MAR 16
Applicable to: ALL

GENERAL

The FWC generates a synthetic voice for radio height announcement below 2 500 ft. These announcements come through the cockpit loudspeakers, even if the speakers are turned off.

PREDETERMINED CALL OUT

The altitude call out uses the following predetermined threshold:

Height (feet)	Call out
2 500	TWO THOUSAND FIVE HUNDRED OR TWENTY FIVE HUNDRED
2 000	TWO THOUSAND
1 000	ONE THOUSAND
500	FIVE HUNDRED
400	FOUR HUNDRED
300	THREE HUNDRED
200	TWO HUNDRED
115	STANDBY (1)
100	ONE HUNDRED
90	STANDBY (1)
65	FLARE (1)
50	FIFTY
40	FORTY
30	THIRTY
20	TWENTY
10	TEN
5	FIVE
DH (or MDA/MDH) + 100	HUNDRED ABOVE
DH (or MDA/MDH)	MINIMUM

(1) *These callouts are triggered only if the Steep Approach and Landing function ◁ is active. In this case, the “ONE HUNDRED” callout is inhibited.*

Note: *The reference altitude for callouts is the radio height for precision approaches (DH), and baro altitude (MDA/MDH) for non precision approaches.*

Pin programming enables Operators to select the required callouts. If the aircraft remains at a height that is in the detection zone for a height callout, the corresponding message is repeated at regular intervals.

INTERMEDIATE CALL OUT

If time between two consecutive predetermined call outs exceeds a certain threshold, the present height is repeated at regular intervals.

The threshold is:
- 11 s above 50 ft
- 4 s below 50 ft

The repeating interval is 4 s.

RETARD ANNOUNCEMENT

The loudspeaker announces RETARD at:

- 20 ft, or
- at 10 ft if autothrust is active and one autopilot is in LAND mode.

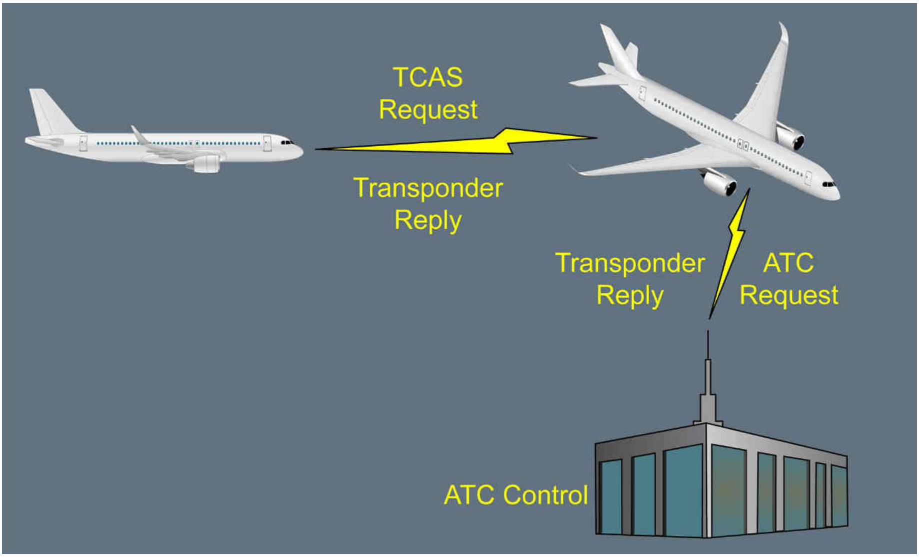
PRINCIPLE

Ident.: DSC-34-SURV-10-10-00020602.0001001 / 17 MAR 17

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03002, 03035-03058, 04563, 05005, 05097

The aircraft has two ATC transponders (XPDR) which are controlled by a control panel (ATC/TCAS) on the center pedestal.
Only the selected XPDR operates.

The XPDR automatically responds to requests:
- From the ATC, to ensure effective air traffic surveillance
- From other aircraft that have a TCAS, to ensure that traffic alerts are triggered.



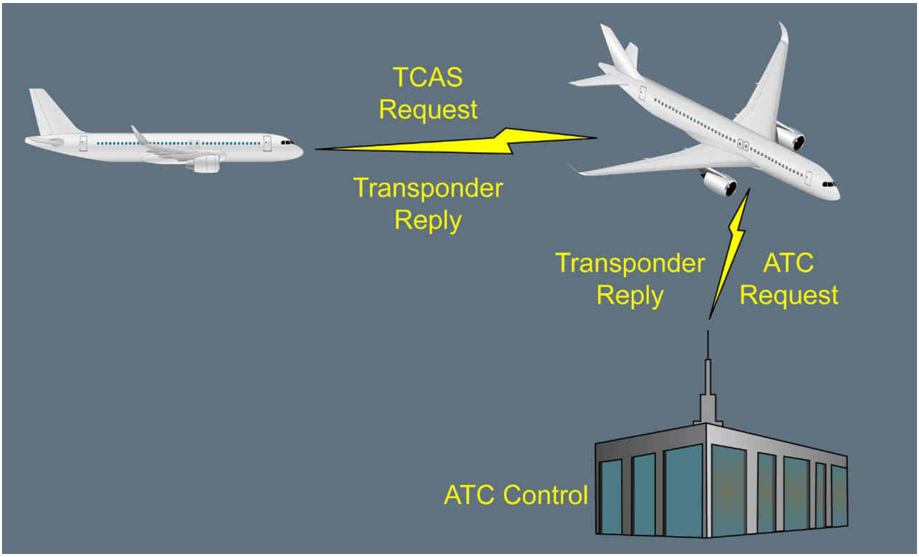
PRINCIPLE

Ident.: DSC-34-SURV-10-10-00020602.0002001 / 17 MAR 17

1 **Applicable to: MSN 03032, 03111-03710, 03733-04544, 04570-04974, 05066, 05101-05987, 06097, 06121, 06139-09324, 10949-11293**

The aircraft has two ATC transponders (XPDR) which are controlled by a control panel (ATC/TCAS) on the center pedestal.
Only the selected XPDR operates.

The XPDR automatically responds to requests:
- From the ATC, to ensure effective air traffic surveillance
- From other aircraft that have a TCAS, to ensure that traffic alerts are triggered.



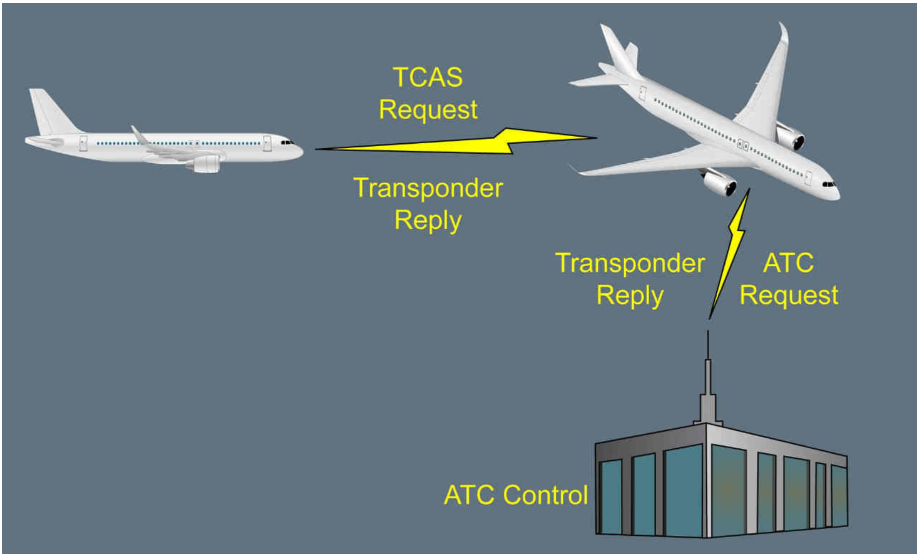
The XPDR is capable of elementary surveillance (ELS) and enhanced surveillance (EHS). It transmits the following data to the ATC center:
- The aircraft 24 bit address, the aircraft altitude, the flight number, the RA report
- The indicated airspeed, the Mach number, and the barometric vertical speed that are all supplied by the ADRs
- The magnetic heading, the roll angle, the ground speed, the track angle, the track angle rate, and the inertial vertical speed, that are all supplied by the IRs
- The selected altitude and barometric reference settings supplied by the FCUs.

PRINCIPLE

2 Ident.: DSC-34-SURV-10-10-00020602.0003001 / 25 MAY 20
Applicable to: MSN 11531

The aircraft has two ATC transponders (XPDR) that are controlled by each of the two RMPs of the center pedestal (and by the third RMP ✳).
Only the selected XPDR operates.

The XPDR automatically responds to requests:
- From the ATC, to ensure effective air traffic surveillance
- From other aircraft that have a TCAS, to ensure that traffic alerts are triggered.

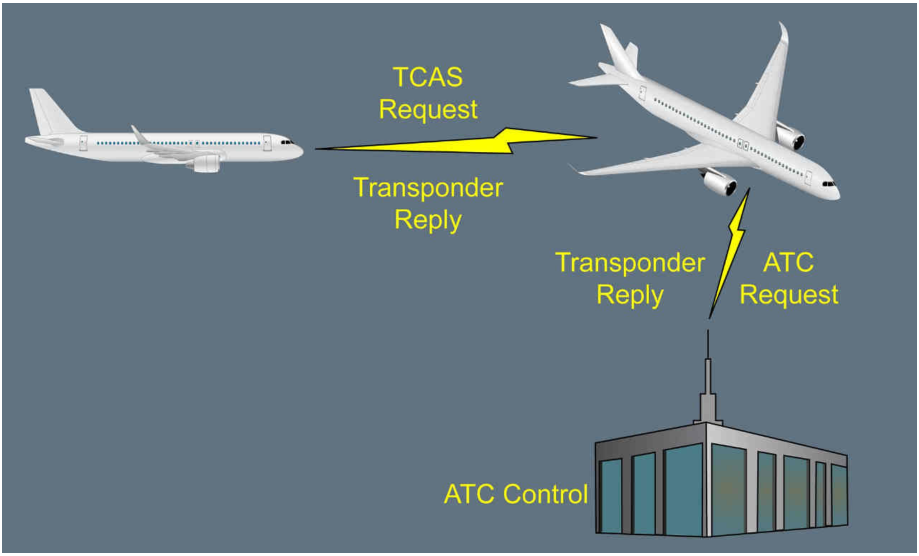


PRINCIPLE

3 Ident.: DSC-34-SURV-10-10-00020602.0004001 / 25 MAY 20
Applicable to: MSN 11482-11522, 11572-11597

The aircraft has two ATC transponders (XPDR) that are controlled by each of the two RMPs of the center pedestal (and by the third RMP ◁).
Only the selected XPDR operates.

The XPDR automatically responds to requests:
- From the ATC, to ensure effective air traffic surveillance
- From other aircraft that have a TCAS, to ensure that traffic alerts are triggered.



The XPDR is capable of elementary surveillance (ELS) and enhanced surveillance (EHS). It transmits the following data to the ATC center:

- The aircraft 24 bit address, the aircraft altitude, the flight number, the RA report
- The indicated airspeed, the Mach number, and the barometric vertical speed that are all supplied by the ADRs
- The magnetic heading, the roll angle, the ground speed, the track angle, the track angle rate, and the inertial vertical speed, that are all supplied by the IRs
- The selected altitude and barometric reference settings supplied by the FCUs.

ADS-B OUT

Ident.: DSC-34-SURV-10-10-00020606.0002001 / 17 MAR 17

4 **Applicable to: MSN 02321, 02734, 02924-03002, 03058, 03180-03211, 03266, 04827-04860, 08495-09324, 10949-11597**

With the ADS-B OUT capability, the Mode S transponders automatically and continuously transmit surveillance data, without preliminary interrogation, to:

- The ATC ground station
- Aircraft capable of ADS-B IN function.

The ADS-B OUT surveillance data that are automatically and continuously transmitted, include the following:

- The latitude and longitude, the Horizontal Integrity Limit (HIL), the difference between barometric altitude and geometric altitude, the ground speed, all supplied by GPS
- The barometric altitude supplied by ADIRS
- The track, the vertical speed, all supplied by the IRs
- The flight number (registered on the ATC flight plan and entered in the FMS during cockpit preparation) supplied by the FMS
- The emergency situation indicator
- The selected altitude and heading, the barometric pressure setting (QNH/QFE) from FCU.

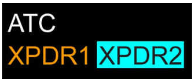
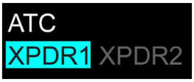
XPDR1(2) is selected. The flight crew can press the RMP L1 key to change the XPDR selection.



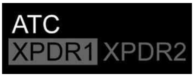
ATC
XPDR1 XPDR2

XPDR1(2) is failed.



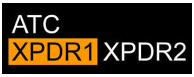
ATC
XPDR1 XPDR2

The link between RMP1 and AMU is failed. The XPDR1 is selected by default. The flight crew cannot select XPDR2.
If the flight crew switches off the RMP1, then RMP2 and RMP3 display the ATC page with the last valid data known before the failure.
Or an internal failure has occurred.



ATC
XPDR1 XPDR2

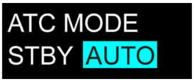
The link between RMP1 and AMU is failed.
If the flight crew switches off the RMP1, then RMP2 and RMP3 display the ATC page with the last valid data known before the failure.
Or an internal failure has occurred.



ATC
XPDR1 XPDR2

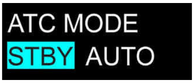
The selected XPDR is failed.

ATC MODE



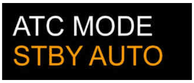
ATC MODE
STBY AUTO

The selected XPDR is in AUTO mode.
In flight, mode S continuously transmits information to other aircraft and replies to requests from aircraft and ground stations.
On ground, modes A and C are inhibited. Mode S (selective calling) and mode ADS-B (data broadcast) are operative.



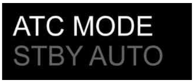
ATC MODE
STBY AUTO

The selected XPDR is in STBY mode.
It does not transmit either reply to ground stations nor to other aircraft.
The TCAS is also in STBY mode.



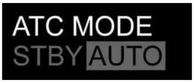
ATC MODE
STBY AUTO

The selected XPDR is failed.



ATC MODE
STBY AUTO

The link between RMP1 and AMU is failed. The flight crew cannot change the ATC Mode.
If the flight crew switches off the RMP1, then RMP2 and RMP3 display the ATC page with the last valid data know before the failure.
Or an internal failure has occurred.



ATC MODE
STBY AUTO

An internal failure has occurred.

IDENT

The flight crew can activate the IDENT function.

IDENT

When the selected XPDR is in AUTO mode, the flight crew can press the RMP L3 key to transmit the aircraft identification signal.

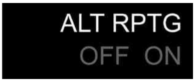
 IDENT TRANSMITTING ID	The selected XPDR is in AUTO mode. If the current squawk code is valid, the aircraft identification signal is transmitted. If the current displayed code is not valid, then all the following occur: - the squawk code reverts to the previous valid code - the SQWK REVERTED TO PREV ENTRY RMP message appears (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*) - the aircraft identification signal is transmitted.
 IDENT	When the selected XPDR is in STBY mode, no aircraft identification signal can be transmitted. If the flight crew presses the RMP L3 key, the DATAFIELD NOT MODIFIABLE RMP message appears (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).
 IDENT	The selected XPDR is failed. No aircraft identification signal can be transmitted.
 IDENT	The link between RMP1 and AMU is failed, or an internal failure has occurred. No aircraft identification signal can be transmitted.

COMMON AREA

Refer to DSC-23-45-10 RMP External Communication.

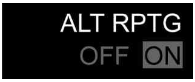
ALT RPTG

 ALT RPTG OFF ON	When the selected XPDR is in AUTO mode, the altitude data transmission is activated. The flight crew can press the RMP R3 key to de-activate the altitude data transmission.
 ALT RPTG OFF ON	When the selected XPDR is in AUTO mode, the altitude data transmission is de-activated. The XPDR does not send any altitude data. The flight crew can press the RMP R3 key to activate the altitude data transmission.
 ALT RPTG OFF ON	When the selected XPDR is in STBY mode, the altitude data transmission is activated. The XPDR does not send any altitude data. The flight crew can press the RMP R3 key to de-activate the altitude data transmission.
 ALT RPTG OFF ON	The selected XPDR is failed. The altitude data transmission cannot be activated.



ALT RPTG
OFF ON

The link between RMP1 and AMU is failed. The altitude data transmission cannot be activated.
If the flight crew switches off the RMP1, then RMP2 and RMP3 display the ATC page with the last valid data know before the failure.



ALT RPTG
OFF ON

An internal failure has occurred.

Intentionally left blank

DESCRIPTION

Ident.: DSC-34-SURV-30-10-00014867.0001001 / 17 MAY 21
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02887, 04563

The aircraft is fitted with one (or two ◁) weather radar system(s) with a Predictive WindShear (PWS ◁) function.
If two weather radar systems are installed, only one system is active at a time. The flight crew can display weather data on the CAPT and/or F/O NDs in either ARC or ROSE mode.
The flight crew can adjust the brightness of the weather image on the ND by rotating the outer knob of the ND Brightness Control knob (*Refer to DSC-31-50 Other EFIS Controls*).

Note: *A low brightness setting of the weather display may reduce the visibility of weather data, and therefore reduce crew awareness of the weather situation.*

The flight crew can adjust manually the antenna tilt settings, and can adjust gain either automatically or manually using knobs located on the radar control panel.

DESCRIPTION

Ident.: DSC-34-SURV-30-10-00014867.0002001 / 17 MAY 21
Applicable to: MSN 02734, 02896-03710, 03733-04544, 04570-05987, 06097, 06121, 06139-09324, 10949-11597

The aircraft is fitted with one or two ◁ Multiscan weather radar systems with a Predictive WindShear (PWS ◁) function and a weather hazard prediction function ◁ .
The flight crew can display weather data on the CAPT and/or F/O NDs in either ARC or ROSE mode.
The flight crew can adjust the brightness of the weather image on the ND by rotating the outer knob of the ND Brightness Control knob (*Refer to DSC-31-50 Other EFIS Controls*).

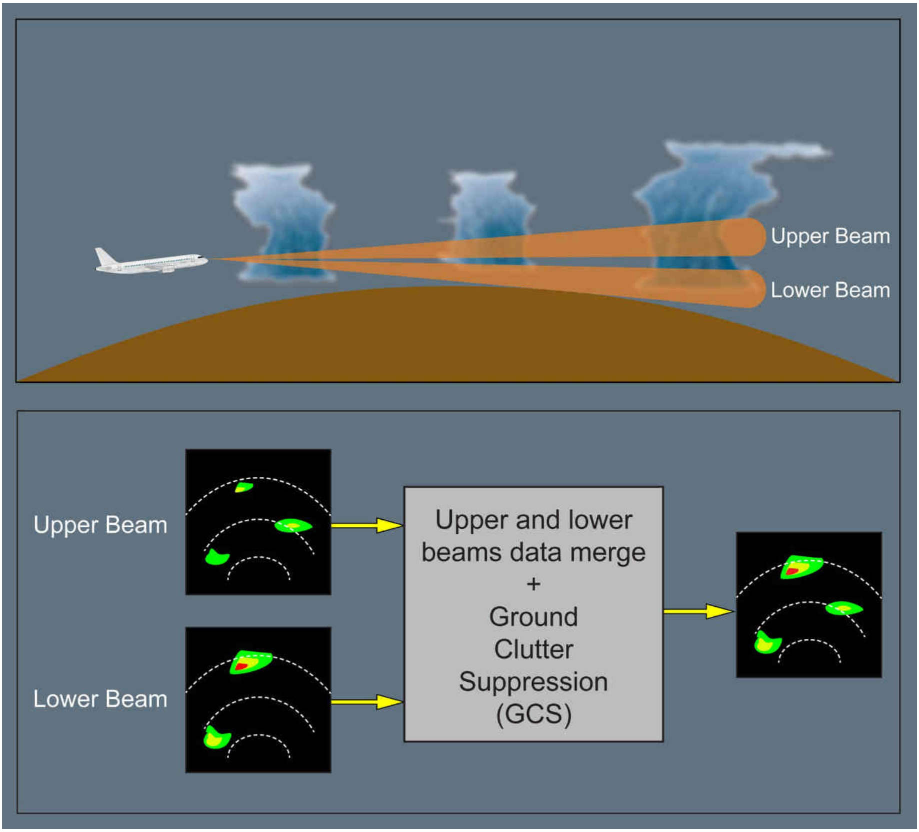
Note: *A low brightness setting of the weather display may reduce the visibility of weather data, and therefore reduce crew awareness of the weather situation.*

The flight crew can use the radar in the following modes:
- Multiscan Automatic mode: MULTISCAN sw set to AUTO (recommended), or
- Manual mode: MULTISCAN sw set to MAN.

When in Multiscan Automatic mode:
- The radar alternatively scans at two antenna tilt settings. The weather radar image that is displayed is the result of the stored and combined information from each beam.
- When the gain selector is set to the Calibrated position (CAL), the radar automatically adjusts the gain based on various parameters (aircraft altitude, geographical area, season, time of the day) to obtain the best weather display.

- To prevent unnecessary clutter display, the “Quiet and Dark cockpit” philosophy removes the weather that:
  - is not on the aircraft flight path
  - is not a threat to the aircraft (post convective cell).
- The Ground Clutter Suppression (GCS) function removes the ground returns from the ND.

Multiscan Principle



Upper Beam
Lower Beam
Upper Beam
Lower Beam
Upper and lower beams data merge
+
Ground Clutter Suppression (GCS)

When in Manual mode:

- The flight crew can adjust manually the antenna tilt settings, and can adjust gain either automatically or manually using knobs located on the radar control panel
- The GCS function is not available
- When the gain selector is set to CAL, there is no automatic gain adjustment based on altitude, geographical area, season and time of the day.

As a consequence, when the flight crew switches from the Multiscan Automatic mode with CAL gain to the Manual mode with CAL gain, the weather displayed on the ND may be significantly different.

Intentionally left blank

GENERAL

Ident.: DSC-34-SURV-30-20-00020942.0004001 / 17 MAR 17

1 **Applicable to: MSN 02734, 02896-03710, 03733-04544, 04570-05987, 06097, 06121, 06139-09324, 10949-11597**

The weather radar has a Predictive WindShear system (PWS) that operates when the PWS switch is in the AUTO position , and the aircraft radio height is below 2 300 ft, and

- Weather radar is ON (Radar sw on position 1 or 2), or
- Weather radar is OFF, and
  - At least one engine is running, and
  - Aircraft ground speed is greater than 30 kt, or
  - Aircraft longitudinal acceleration is above a given threshold during at least 0.5 s.

Note: *If two weather radars are installed, when the selected weather radar fails, the flight crew can recover the PWS function by selecting the operative system on the Radar sw of the radar control panel.*

The system scans the airspace for windshear within a range of 5 NM ahead of the aircraft. When the system detects windshear, a windshear symbol appears on the ND (*Refer to DSC-34-SURV-30-30 PWS (if installed) indication on PFD and ND*).
Predictive windshear warnings and cautions are associated to an aural alert and to a red (warning) or amber (caution) "W/S AHEAD" message on the PFD, whereas windshear advisories are only displayed on the ND (*Refer to DSC-34-SURV-30-30 PWS (if installed) indication on PFD and ND*) without message on the PFD.

Alert Level	**Aural Warning**	**PFD**	**ND (*Refer to DSC-34-SURV-30-30 PWS (if installed) indication on PFD and ND*)**

GENERAL

Ident.: DSC-34-SURV-30-20-00020942.0001001 / 17 MAR 17

Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02887, 04563

The weather radars have a Predictive Windshear System (PWS) that operates when:

- The PWS switch is in the AUTO position (Even if the weather radar is OFF), and
- The aircraft is below 2 300 ft AGL, and

- The ATC is switched to the ON, or AUTO, or XPDR, or XPNDR, position (depending on the ATC panel), and
- Either engine is running.

Note: *When two weather radars are installed, if the selected weather radar fails, the PWS function is recovered by selecting the non-failed weather radar on the control panel.*

The system scans the airspace, within a range of 5 NM ahead of the aircraft, for windshears. When the system detects windshear, depending on the range selected on the ND, a warning, caution, or advisory message appears on the ND. Predictive windshear warnings and cautions are associated with an aural warning.
Predictive windshear warnings and cautions are associated to an aural alert and to a red (warning) or amber (caution) "W/S AHEAD" message on the PFD, whereas windshear advisories are only displayed on the ND (*Refer to DSC-34-SURV-30-30 PWS (if installed) indication on PFD and ND*) without message on the PFD.

WINDSHEAR ALERTS INHIBITION

Ident.: DSC-34-SURV-30-20-00006426.0002001 / 20 JUL 15
4 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

At takeoff, alerts are inhibited above 100 kt and up to 50 ft.
During landing, alerts are inhibited below 50 ft.

The aural alerts of the Predictive WindShear system (PWS):
- Have priority over TCAS, GPWS, and other FWC aural warnings
- Are inhibited by reactive windshear detection and aural messages of stall warnings.

(1) Radar sw
This switch sets one radar to ON or turns both radars to OFF.

Note: *If only one radar is installed on the aircraft, either:*
- *a "INOP" or "DEACT" sticker replaces the "2", or*
- *a "ON/OFF" Radar sw replaces the "1/OFF/2" Radar sw.*

Note: *If only one radar is installed on the aircraft, no weather image is displayed on the Navigation Display (ND) when the "1/OFF/2" SYS sw is set to "2".*

(2) GAIN knob
This knob adjusts the sensitivity of the radar.

CAL is the normal position of the knob :

- When in Multiscan Automatic mode and gain set to CAL, the radar automatically adjusts the gain according to various parameters (aircraft altitude, geographical area, season, time of the day) to obtain the best weather display
- When in Manual mode and gain set to CAL, the radar adjusts the gain to a calibrated setting.

(3) Display mode selector

WX : Weather mode :
Colors indicate the intensity of precipitation (black for the lowest intensity, green, amber and red indicate progressively higher intensity).

WX+T : Weather and Turbulence mode :
The ND indicates precipitation and turbulence areas. Turbulence areas are displayed in magenta (within 40 NM).

TURB ◁✳ : Turbulence mode :
The ND only displays turbulence areas in magenta (within 40 NM).

WX+T+HZD: ◁✳ Weather, Turbulence and Hazard mode (recommended position) :
The ND indicates precipitation, turbulence areas in magenta (within 40 NM) and hazard prediction risk areas.
Hazard prediction function is only available when the MULTISCAN sw is set to AUTO.

Note: *When MULTISCAN sw is set to MAN, WX+T+HZD mode is equivalent to WX+T mode.*

MAP : Map mode :
The radar operates in ground mapping mode: black indicates water, green indicates the ground, and amber indicates cities and mountains.

(4) TILT knob

This knob adjusts the antenna tilt when MULTISCAN sw is set to MAN.
Zero indicates the horizon reference provided by the IRS.

(5) MULTISCAN sw

AUTO : Activates Multiscan mode
Multiscan controls the tilt automatically and combines two scans done at different tilt angles to optimize weather detection and minimize ground clutter.

MAN : When set to MAN, the crew can manually adjust the tilt by using the TILT knob.

(6) GCS sw

The Ground Clutter Suppression (GCS) switch is spring-loaded to the AUTO position.

AUTO : - If MULTISCAN sw is set to AUTO, the radar is in normal use. Ground clutter is not displayed on the screen
- If MUTLISCAN sw is set to MAN, the GCS sw has no utility. Ground clutter is displayed on the screen.

OFF : Ground clutter is displayed on the screen.

(7) PWS sw ◁*

AUTO : Activates the Predictive WindShear function in accordance with activation conditions (*Refer to DSC-34-SURV-30-20 Windshear Alerts Above 50 feet*).

OFF : The Predictive WindShear function is off.

CONTROL PANEL

Ident.: DSC-34-SURV-30-30-00001402.0010001 / 01 MAR 18

(1) Radar sw

Note: *If only one radar is installed on the aircraft, either:*
- *a "INOP" or "DEACT" sticker replaces the "2", or*
- *a "ON/OFF" Radar sw replaces the "1/OFF/2" Radar sw.*

This switch sets:
- the radar to ON or OFF (if only one radar is installed on the aircraft), or
- one radar to ON or turns off both radars (if two radars are installed on the aircraft).

Note: *If only one radar is installed on the aircraft, no weather image is displayed on the Navigation Dislplay (ND) when the "1/OFF/2" Radar sw is set to "2".*

(2) GAIN knob
This knob adjusts the sensitivity of the radar.
“CAL” is the normal position; it adjusts the gain to a calibrated setting.

(3) Display mode selector

WX : Weather mode :
Colors indicate the intensity of precipitation (black for the lowest intensity, green, amber and red indicate progressively higher intensity).

WX+T : Weather and Turbulence mode :
The ND indicates precipitation and turbulence areas. Turbulence areas are displayed in magenta (within 40 NM).

TURB ◁✳ : Turbulence mode :
The ND only displays turbulence areas in magenta (within 40 NM).

MAP : Map mode :
The radar operates in ground mapping mode: black indicates water, green indicates the ground, and amber indicates cities and mountains.

(4) TILT knob
This knob adjusts antenna tilt above and below the horizon.
Zero indicates the horizon reference, as provided by the ADIRS.

(5) GND CLTR SPRS sw

ON : Suppresses the ground echo on the screen.

OFF : Normal use of the radar.

(6) PWS sw ◁✳

Note: *If the PWS function is not installed on the aircraft, a "INOP" sticker can replace the PWS sw.*

AUTO : Activates the Predictive WindShear function in accordance with activation conditions.

OFF : Turns off the predictive windshear function.

WEATHER RADAR INDICATION ON ND

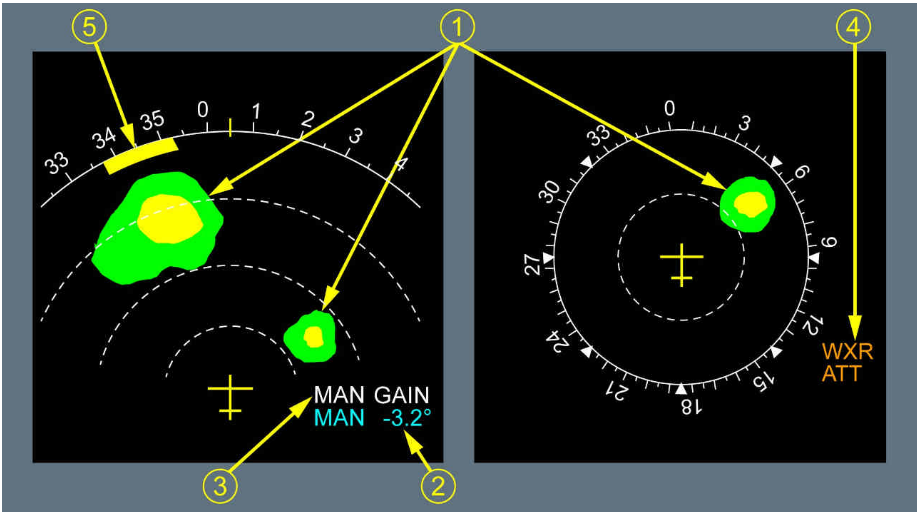
Ident.: DSC-34-SURV-30-30-00001255.0007001 / 21 MAR 16
Applicable to: MSN 03035-03047, 03111, 04953-04974



(1) Weather Radar Picture

- When the radar is operating, and when the ND is not in PLAN mode, the ND displays the weather radar picture.
- The weather echoes appear in different colors, depending on the precipitation rates (black, green, yellow, red or magenta for turbulence).
- The selected ND range will determine how often the image is refreshed.

(2) Tilt Angle

- The multiscan function of the weather radar alternatively scans at low and high beam, and automatically sets the tilt of these beams to optimize the weather radar detection. The displayed weather radar picture is the result of the storing and merging of the information from each beam.
- The tilt angle is the angle between the horizon and the radar beam axis. The value of the tilt angle is in degrees, and quarters of a degree. It appears in the lower right corner of the screen:
  - In green, when the MULTISCAN sw is set to AUTO. This value represents the average of the lower and the upper beam tilts.
  - In blue, next to the blue “MAN” indication, when the flight crew sets the MULTISCAN sw to MAN.
  - When the multiscan function is lost, the tilt value is dashed and the “NO AUTO TILT” message appears in amber on the ND, until the flight crew sets the MULTISCAN sw to MAN.

(3) Gain Mode

- ”MAN GAIN” appears in white, when the flight crew selects the manual gain mode.

(4) Failure Messages
The ND lists the detected failures.
If the message is in “red”, the ND does not display a radar image.
If the message is in “amber”, the image is not affected.

NO WXR (red)	:	Radar System failure.
WXR RT (red)	:	Radar transceiver failure.
WXR ANT (red)	:	Radar antenna failure.
WXR CTL (red)	:	Radar control unit failure.
WXR RNG (red)	:	Range error.
WXR WEAK (amber)	:	Calibration failure.
WXR ATT (amber)	:	Attitude control failure.

WXR STAB (amber) : Antenna stabilization failure.

PRED W/S (amber) : PWS ◁ function failure.

NO AUTO TILT (amber) : Automatic tilt adjustment failure.

WXR TEST (amber) : Radar System test.

(5) PAC alert

When the flight crew sets the display mode selector to WX or WX+T, or WX+T+HZD ◁ and sets the gain to CAL, and when the aircraft is within 80 NM of a storm cell, the Path Attenuation Compensation (PAC) alert is available.

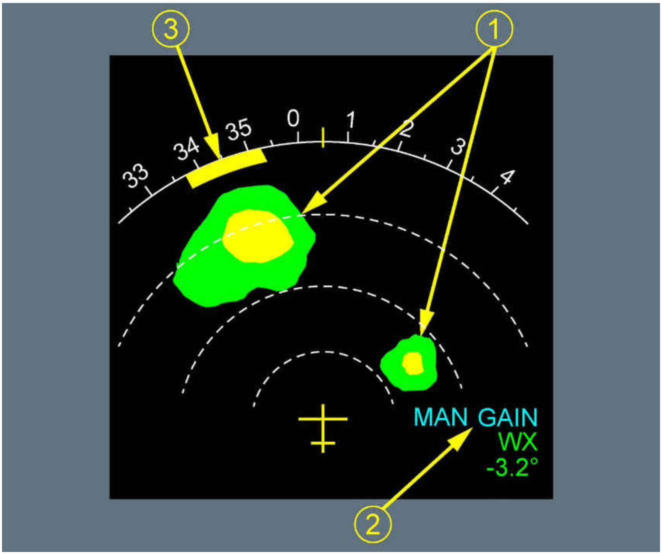
The PAC alert displays a yellow arc on the outermost scale of the ND, when an intervening rainfall creates an attenuated area behind a storm cell (also called a radar shadow or attenuation effect).

Note: *The PAC alert is only available when the MULTISCAN sw is in the AUTO position.*

WEATHER RADAR INDICATION ON ND

Ident.: DSC-34-SURV-30-30-00001255.0014001 / 21 MAR 17

2 **Applicable to: MSN 02734, 02896-03032, 03058, 03180-03710, 03733-04544, 04570-04860, 05005-05987, 06097, 06121, 06139-09324, 10949-11597**



(1) Weather Radar Picture

- When the radar is operating, and when the ND is not in PLAN mode, the ND displays the weather radar picture.
- The weather echoes appear in different colors, depending on the precipitation rates (black, green, yellow, red or magenta for turbulence).
- The selected ND range will determine how often the image is refreshed.

(2) Weather Radar Indication

- 1st row: Gain Mode
  MAN GAIN appears in cyan when the flight crew selects the manual gain mode.
- 2nd row: Active Detection Mode
  - WX
  - WX+T
  - TURB ◁
  - MAP
  - WX+T+H ◁
  - PWS SCAN ◁ (only in green when the PWS function is active)
  - WXR OFF (only in white)

Note: *Except for PWS SCAN and WXR OFF, the active detection modes are displayed:*

- *In cyan if the manual mode is selected*
- *In green if the automatic mode is selected*

- 3rd row: Tilt Angle
  The multiscan function of the weather radar alternatively scans at low and high beam, and automatically sets the tilt of these beams to optimize the weather radar detection. The displayed weather radar picture is the result of the storing and merging of the information from each beam.

  The tilt angle is the angle between the horizon and the radar beam axis. The value of the tilt angle is in degrees, and quarters of a degree. It is displayed:
  - In green, when the MULTISCAN sw is set to AUTO. This value represents the average of the lower and the upper beam tilts.
  - In cyan, next to the "MAN" indication, when the flight crew sets the MULTISCAN sw to MAN.

  When the multiscan function is lost, the tilt value is dashed and the “NO AUTO TILT” message appears in amber on the ND, until the flight crew sets the MULTISCAN sw to MAN.
- 4th row: Failure Messages
  The ND lists the detected failures.
  If the message is in "red", the ND does not display any radar image.
  If the message is in “amber”, the image is not affected.

NO WXR (red)	:	Radar display failure.
WXR RT (red)	:	Radar transceiver failure.
WXR ANT (red)	:	Radar antenna failure.
WXR CTL (red)	:	Radar control unit failure.
WXR RNG (red)	:	Range error.
WXR DU (red)	:	Overheating of the display unit
WXR WEAK (amber)	:	Calibration failure.
WXR ATT (amber)	:	Attitude control failure.
WXR STAB (amber)	:	Antenna stabilization failure.
PRED W/S (amber)	:	PWS ◁ function failure.
NO AUTO TILT (amber)	:	Automatic tilt adjustment failure.
WXR TEST (amber)	:	Radar system test.

(3) Path Attenuation Compensation (PAC) Alert
When the flight crew sets the display mode selector to WX or WX+T, or WX+T+HZD ◁ and sets the gain to CAL, and when the aircraft is within 80 NM of a storm cell, the PAC alert is available.
The PAC alert displays a yellow arc on the outermost scale of the ND, when an intervening rainfall creates an attenuated area behind a storm cell (also called a radar shadow or attenuation effect).

Note: *The PAC alert is only available when the MULTISCAN sw is in the AUTO position.*

PWS ⊲ INDICATION ON PFD AND ND

Ident.: DSC-34-SURV-30-30-00020941.0002001 / 01 MAR 18

3 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

W/S SET RNG 10 NM
PWS SCAN

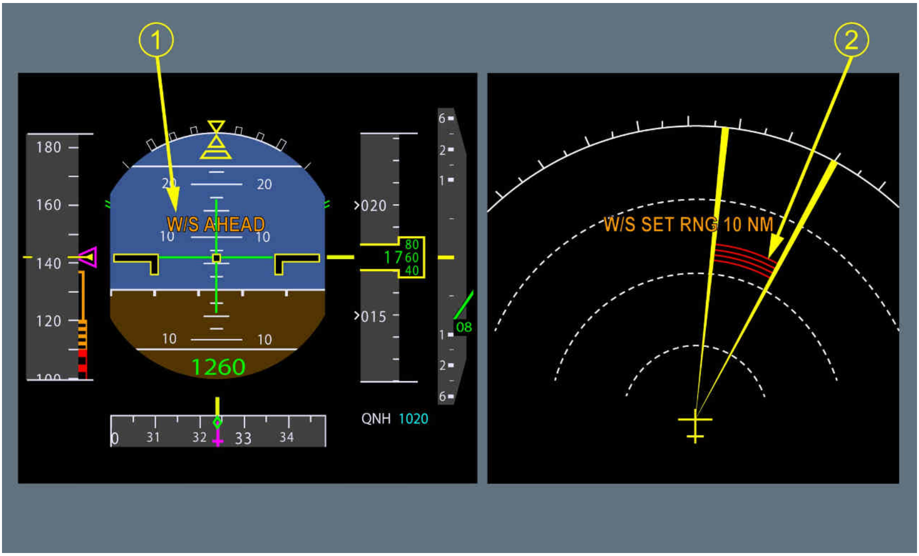
(1) W/S AHEAD message on the PFD
This message is displayed, when the Predictive WindShear system detects windshear ahead of the aircraft.
The message is in amber or red, depending on the level of the alert.

(2) Predictive WindShear area indication
A red and black symbol and two yellow radial lines indicate the predicted windshear area.
Windshear indication is available in ARC and ROSE ND modes.
When the radar detects a windshear event and the ND range is set above 10 NM, a W/S SET RNG 10 NM (Windshear, set range to 10 NM) message appears. This message requests the flight crew to adjust the range on the corresponding ND.
Depending on the windshear alert level, ND indication may be associated with an aural message and a PFD message.

(3) PWS SCAN message on the ND
If only the PWS detection is active, the ND displays a PWS SCAN message when the PWS is active. In this mode, when the radar detects a windshear event, a windshear symbol and the weather returns appear automatically on the ND.

PWS INDICATION ON PFD AND ND

Ident.: DSC-34-SURV-30-30-00020941.0001001 / 01 MAR 18
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321



(1) W/S AHEAD message on the PFD
This message is displayed, when the Predictive WindShear system detects windshear ahead of the aircraft.
The message is in amber or red, depending on the level of the alert.

(2) Predictive WindShear area indication
A red and black symbol and two yellow radial lines indicate the predicted windshear area.
Windshear indication is available in ARC and ROSE ND modes.
When the radar detects a windshear event and the ND range is set above 10 NM, a W/S SET RNG 10 NM (Windshear, set range to 10 NM) message appears. This message requests the flight crew to adjust the range on the corresponding ND.

Depending on the windshear alert level, ND indication may be associated with an aural message and a PFD message.

WEATHER HAZARD PREDICTION FUNCTION INDICATION ON ND

4 Ident.: DSC-34-SURV-30-30-00016149.0001001 / 17 MAY 21
Applicable to: MSN 11531

The Weather, Turbulence and Hazard mode (WX+T+HZD) enables the flight crew to have the following information displayed on the ND:

- The weather returns that appear in different colors, depending on the precipitation rates (black, green, yellow or red)
- The turbulence areas in magenta (within 40 NM)
- The weather hazard predictions computed by the weather radar.

For the weather hazard predictions:

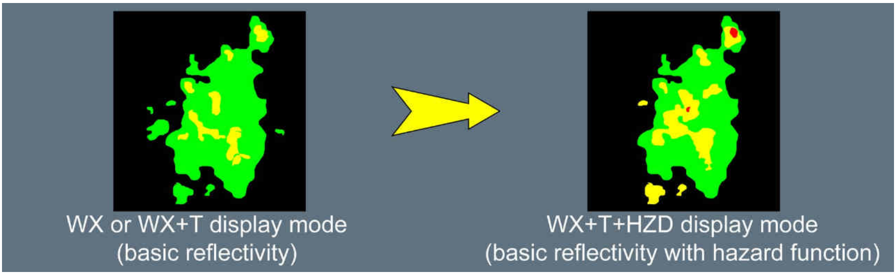
- The weather radar computes an automatic threat assessment of the lightning, hail and convective activity in a storm cell and in the area near the storm cell (Core Threat Assessment and Associated Threat Assessment)
- The weather radar is also able to alert the flight crew of storm cells that may rapidly build below the aircraft flight path (Predictive Overflight).

Note: *The hazard predictions are only available when the Multiscan mode is in AUTO.*

CORE THREAT ASSESSMENT

The Core Threat Assessment function operates until 320 NM. In case the weather radar determines that lightning, hail or turbulence may occur in a given cell, native reflectivity color of the weather is increased in order to better reflect the threat associated with a cell core.
The adjustment can go up to a color level (green cells may become yellow, yellow cells may become red).

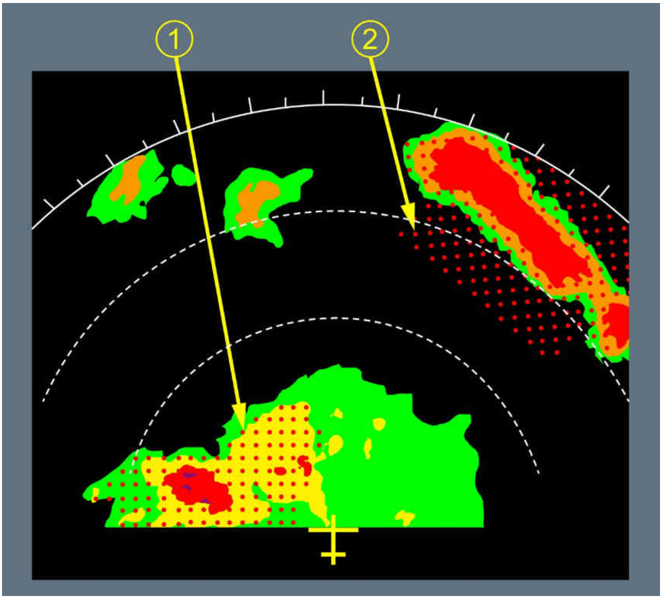
Core Threat Assessment



ASSOCIATED THREAT ASSESSMENT

Associated threat assessment enables to indicate an area of possible hail, lightning, and convection on the ND. This permits to identify potential threats even if there is no reflective activity in the area.

Associated Threat Assessment



Associated threats are represented by red dots on the ND and can be within the cell boundary or outside. Two types of indications can be displayed:

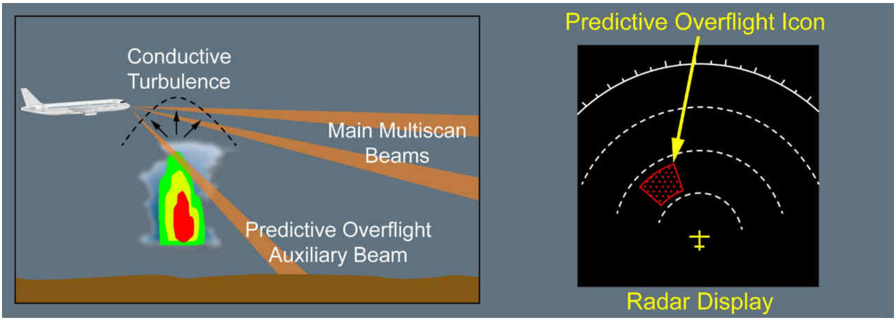
(1) The first type of indication is represented by red dots in the area of potential lightning and icing found in precipitation around the freezing level. This information is available only when the aircraft is below the freezing level or up to 6 000 ft above the freezing level.

(2) The second type of indication is represented by red dots in a rectangular shape on top of a storm cell displayed on the ND. The doted rectangle above a storm cell indicates a potential of icing, hail and/or lightning. This information is available at all altitudes. The rectangle may extend beyond the storm cell to indicate potential threats that can not be seen by the basic reflectivity function of the weather radar.

PREDICTIVE OVERFLIGHT FUNCTION

The predictive overflight function is active above 25 000 ft and operates up to 40 NM. Its aim is to indicate risk constituted by cells growing rapidly underneath main radar beams. For this purpose, an auxiliary beam with very low tilt searches for growing cells. When a conflict between a fast growing cell and the aircraft flight path is detected, a Predictive Overflight icon is displayed.
The Predictive Overflight icon is represented by an area of red dots with red boundaries.
As it is based on actual convection measurement, the flight crew should avoid predictive overflight areas.

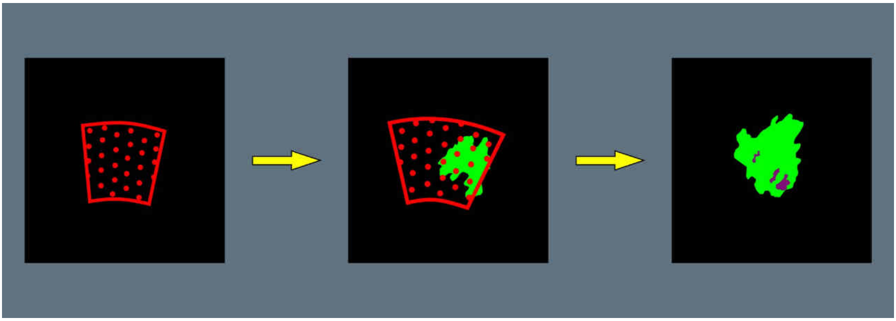
Predictive Overflight Function



Conductive Turbulence
Main Multiscan Beams
Predictive Overflight Auxiliary Beam
Predictive Overflight Icon
Radar Display

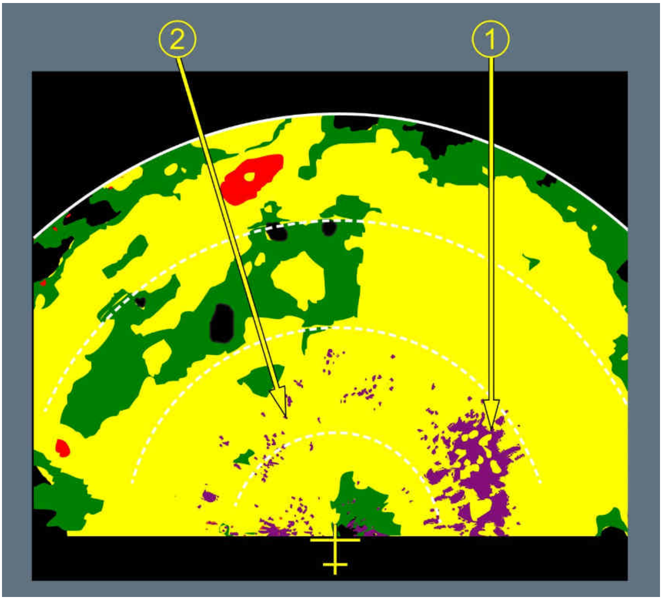
First, the icon is displayed “alone” over black when the concerned cell can not be displayed (the cell is much lower than aircraft flight level). Then, when cell reach aircraft flight level, the icon and the reflectivity are displayed together. Finally, the icon is removed 1 min after cell ceases to be considered as a threat by the weather radar or when the relevant depiction (i.e. at least red core) for the cell is displayed on ND.

Predictive Overflight Icon Evolution



SEVERE AND MODERATE TURBULENCE DISPLAY

Example of Severe and Moderate Turbulence Display



The weather hazard prediction function provides two levels of turbulence:

(1) Basic plain magenta:
It indicates potential severe turbulences (available in WX+T or WX+T+HZD display mode).

(2) Speckle magenta:
It indicates potential moderate turbulences that could decrease passenger comfort (available only in WX+T+HZD display mode).

MEMO DISPLAY

Ident.: DSC-34-SURV-30-30-00017051.0001001 / 21 MAR 16

5 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The "PRED W/S OFF" message appears when windshear is set to OFF on the weather radar panel.

PRED W/S OFF : This memo appears in green during flight phases 2 and 6.

PRED W/S OFF : This memo appears in amber when:

- The aircraft is in flight phases 3, 4, 5, 7, 8, and 9.
- The T.O. CONFIG pb is pressed during flight phase 2.

OVERVIEW

Ident.: DSC-34-SURV-40-10-00021292.0001001 / 17 MAR 17
Applicable to: ALL

The purpose of the Ground Proximity Warning System (GPWS) is to warn the flight crew of potentially hazardous situations, such as a collision with terrain. It detects terrain collision threats and triggers applicable aural and visual indications.

The GPWS includes:

- Five basic modes active up to radio height of 2 500 ft.
  - Excessive rate of descent (Mode 1)
  - Excessive terrain closure rate (Mode 2)
  - Altitude loss after takeoff or go-around (Mode 3)
  - Terrain clearance not sufficient, if not in landing configuration (Mode 4)
  - Excessive descent below the glide slope (Mode 5).
- A predictive GPWS ◁ function, based on a GPWS database, to display terrain information. It can be provided:
  - By Honeywell through Enhanced GPWS (EGPWS)
  - By ACSS as Ground Collision Avoidance System (GCAS), through T2CAS or T3CAS.

  The predictive GPWS is composed of:
  - Mandatory functions such as the Forward Looking Terrain Alerting function
  - Optional functions such as the obstacle database.

Note: *The terrain data are displayed on the ND and the brightness is controlled via the weather radar brightness control knob. If the weather radar brightness was set to low (due to bad weather) and a terrain alert occurs, then the brightness of the terrain display will also be low.*

PRINCIPLE

Ident.: DSC-34-SURV-40-10-00021293.0001001 / 17 MAR 17
Applicable to: ALL

The GPWS computes the geometric altitude of the aircraft by using:

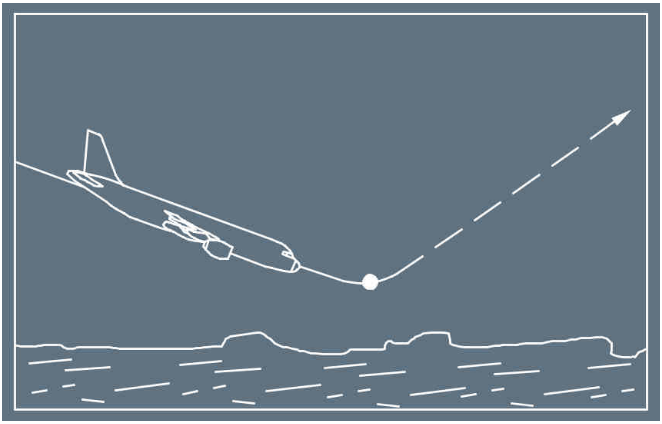
- Pressure altitude
- Radio altitude
- Temperature
- Barometric references

- GPS altitude for predictive GPWS ◁
- Data from the GPWS database for predictive GPWS ◁ .

MODE 1 : EXCESSIVE RATE OF DESCENT

Ident.: DSC-34-SURV-40-20-00015115.0001001 / 13 JAN 14

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321



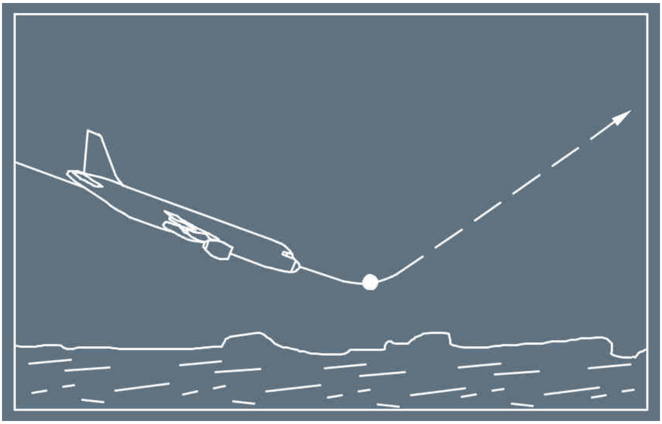
Mode 1 triggers aural and visual alerts about excessive rates of descent, based on the radio height, and the rate of descent of the aircraft.
Mode 1 is active for all phases of the flight.

	CAUTION		WARNING	
AURAL ALERT	"SINK RATE, SINK RATE"		"PULL UP" (repeated as long as MODE 1 is triggered)	
VISUAL ALERT	GPWS	The GPWS red lights come on	GPWS	The GPWS red lights come on

MODE 1 : EXCESSIVE RATE OF DESCENT

Ident.: DSC-34-SURV-40-20-00015115.0004001 / 13 JAN 14

Applicable to: MSN 02014, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597



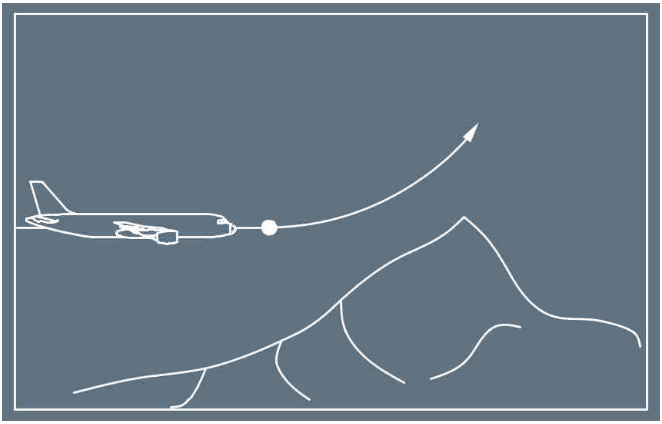
Mode 1 triggers aural and visual alerts about excessive rates of descent, based on the radio height, and the rate of descent of the aircraft.

Mode 1 is active for all phases of the flight.

	CAUTION		WARNING	
AURAL ALERT	"SINK RATE, SINK RATE"		"PULL UP" (repeated as long as MODE 1 is triggered)	
VISUAL ALERT		The GPWS amber lights come on		The PULL UP red lights come on

MODE 2 : EXCESSIVE TERRAIN CLOSURE RATE

Ident.: DSC-34-SURV-40-20-00015116.0001001 / 23 JUN 15
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321



Mode 2 triggers two types of aural and visual alerts, based on the landing gear/flaps configuration of the aircraft, the radio height, and the RA rate of change.
There are two types of Mode 2 alerts, Mode 2A (active during climb, cruise, and initial approach), and Mode 2B (active during approach and 60 s after takeoff).

CONFIGURATION	Flaps not in Landing Position + Landing Gear Up (Mode 2A) Flaps Down + Landing Gear Up (Mode 2B)		
	CAUTION	WARNING	
AURAL ALERT	"TERRAIN, TERRAIN"	"PULL UP" (repeated as long as MODE 2 is triggered in the warning conditions)	"TERRAIN" (repeated as long as MODE 2 is triggered after leaving the warning conditions)
VISUAL ALERT	GPWS The GPWS red lights come on	GPWS The GPWS red lights come on	GPWS The GPWS red lights come on

CONFIGURATION	Flaps Down + Landing Gear Down (Mode 2B)
AURAL ALERT	**CAUTION** "TERRAIN" (repeated as long as MODE 2 is triggered)
VISUAL ALERT	GPWS The GPWS red lights come on

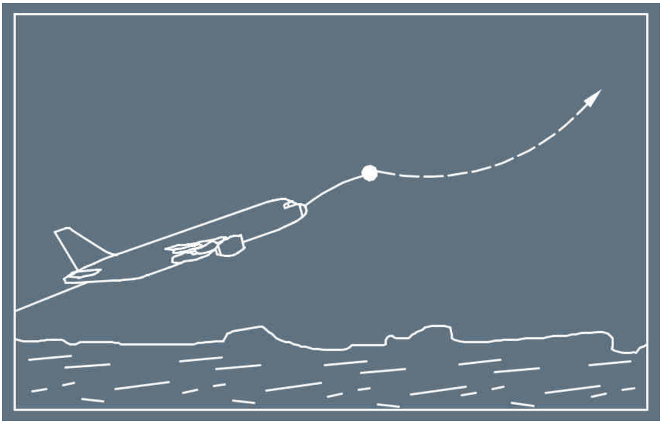
	CAUTION
AURAL ALERT	"TERRAIN" (repeated as long as MODE 2 is triggered)
VISUAL ALERT	GPWS The GPWS amber lights come on

MODE 3 : ALTITUDE LOSS AFTER TAKEOFF

Ident.: DSC-34-SURV-40-20-00015117.0004001 / 19 SEP 13

3 **Applicable to: MSN 02014, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

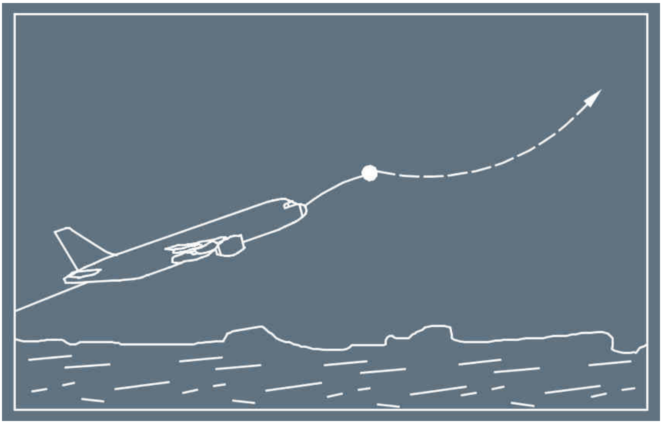


Mode 3 triggers aural and visual alerts when the altitude significantly decreases after takeoff, and go-arounds with landing gear or flaps not in landing configuration.

	CAUTION
AURAL ALERT	"DON'T SINK, DON'T SINK" (repeated as long as MODE 3 is triggered)
VISUAL ALERT	GPWS The GPWS amber lights come on

MODE 3 : ALTITUDE LOSS AFTER TAKEOFF

Ident.: DSC-34-SURV-40-20-00015117.0001001 / 19 SEP 13
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321

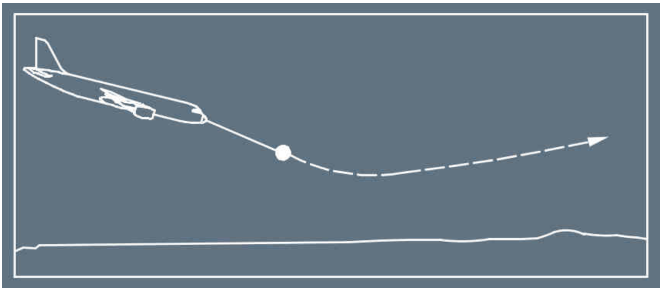


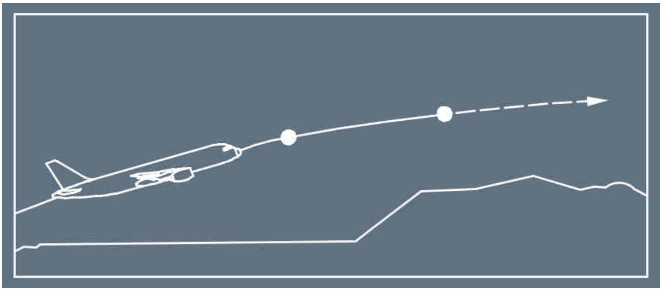
Mode 3 triggers aural and visual alerts when the altitude significantly decreases after takeoff, and go-arounds with landing gear or flaps not in landing configuration.

	CAUTION
AURAL ALERT	"DON'T SINK, DON'T SINK" (repeated as long as MODE 3 is triggered)
VISUAL ALERT	GPWS The GPWS red lights come on

MODE 4 : UNSAFE TERRAIN CLEARANCE WHEN NOT IN LANDING CONFIGURATION

Ident.: DSC-34-SURV-40-20-00015118.0003001 / 13 JAN 14
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321



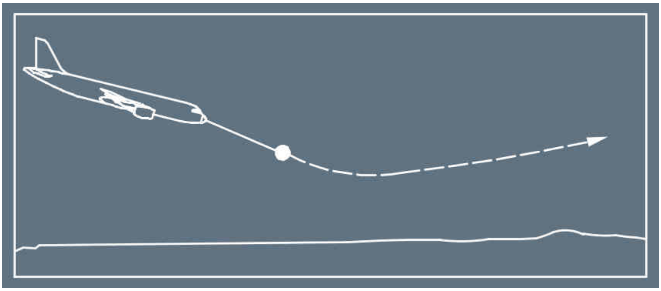


There are three types of Mode 4 alerts, Mode 4A and Mode 4B (both active during cruise and approach), and Mode 4C (active during takeoff).
Mode 4A and Mode 4B trigger aural and visual alerts when terrain clearance is not sufficient based on the phase of flight, the configuration of the landing gear and the flaps, and the speed. Mode 4C triggers aural and visual alerts based on the minimum terrain clearance and the radio height of the aircraft.

CONFIGURATION	Landing gear Up (Mode 4A)		Flaps not in landing position + Landing gear down (Mode 4B)		Flaps not in landing position OR Landing Gear Up (Mode 4C)
AURAL ALERT	CAUTION				
	"TOO LOW TERRAIN"	"TOO LOW GEAR"	"TOO LOW TERRAIN"	"TOO LOW FLAPS"	"TOO LOW TERRAIN"
VISUAL ALERT	GPWS The GPWS red lights come on				

MODE 4 : UNSAFE TERRAIN CLEARANCE WHEN NOT IN LANDING CONFIGURATION

Ident.: DSC-34-SURV-40-20-00015118.0004001 / 19 SEP 13
Applicable to: MSN 04827-04860



There are two types of Mode 4 alerts, Mode 4A and Mode 4B (both active during cruise and approach).
Mode 4A and Mode 4B trigger aural and visual alerts when terrain clearance is not sufficient based on the phase of flight, the configuration of the landing gear and the flaps, and the speed.

CONFIGURATION	Landing gear Up (Mode 4A)		Flaps not in landing position + Landing gear down (Mode 4B)

TERRAIN AWARENESS AND DISPLAY

Ident.: DSC-34-SURV-40-35-00001417.0277001 / 16 NOV 20
Applicable to: MSN 06528-06561, 06598, 06634, 06689-06712, 06800-06876

The TAD function computes a caution and a warning envelope in front of the aircraft, depending on all of the following:

- The aircraft altitude
- The nearest runway altitude
- The distance to the nearest runway threshold
- The ground speed
- The turn rate.

When the boundary of these envelopes conflicts with the terrain, or with an obstacle memorized in the database, the system generates the related alert:

Alert Level	Aural Warning	ND (*Refer to DSC-31-45 Flags and Messages Displayed on ND*)	Local Warning
Warning	**TERRAIN TERRAIN PULL UP**	- Automatic terrain display(1) - Solid red areas - TERRAIN	On each pilot’s instrument panel, the pushbutton light comes on.
	OBSTACLE OBSTACLE, PULL UP	- Automatic terrain display(1) - Solid red areas - OBST	
Caution	**CAUTION TERRAIN**	- Automatic terrain display(1) - Solid yellow areas - TERRAIN	
	CAUTION OBSTACLE	- Automatic terrain display(1) - Solid yellow areas - OBST	

(1) *Depending on the aircraft position, when the TERR ON ND pb is set to ON, and the ARC or ROSE mode is selected, the ND displays both of the following:*
- *The terrain*
- *The obstacles memorized in the database.*

The terrain appears in various densities of green, yellow, red, or magenta, depending on the threat (*Refer to DSC-31-45 Flags and Messages Displayed on ND*). If an alert is generated (caution or warning), and TERR ON ND pb is not selected by the flight crew, the terrain and the obstacles automatically appear, and the ON light of the TERR ON ND pb comes on.

Note: 1. *When TERR ON ND pb is selected by the flight crew, the weather radar image does not appear*
2. *The Geometric Altitude function can protect against some BARO setting errors, provided the components used to compute the Geometric Altitude are valid and sufficiently accurate*
3. *The TAD and TCF functions operate with the use of the pure lateral GPS position. The FMS1 position provides the backup.*

If the FMGC detects low-navigation accuracy, then the enhanced modes of the EGPWS are automatically deactivated. The 5 GPWS modes remain active.

TERRAIN AWARENESS AND DISPLAY

Ident.: DSC-34-SURV-40-35-00001417.0275001 / 16 NOV 20

1 **Applicable to: MSN 02321, 02887-03710, 03733-04773, 04953-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11597**

The TAD function computes a caution and a warning envelope in front of the aircraft, depending on all of the following:
- The aircraft altitude
- The nearest runway altitude
- The distance to the nearest runway threshold
- The ground speed
- The turn rate.

When the boundary of these envelopes conflicts with the terrain, or with an obstacle memorized in the database, the system generates the related alert:

Alert Level	Aural Warning	ND (*Refer to DSC-31-45 Flags and Messages Displayed on ND*)	Local Warning
Warning	**TERRAIN AHEAD, PULL UP**	- Automatic terrain display(1) - Solid red areas - TERR AHEAD	On each pilot's instrument panel, the pushbutton light comes on.
	OBSTACLE AHEAD, PULL UP	- Automatic terrain display(1) - Solid red areas - OBST AHEAD	
Caution	**TERRAIN AHEAD**	- Automatic terrain display(1) - Solid yellow areas - TERR AHEAD	
	OBSTACLE AHEAD	- Automatic terrain display(1) - Solid yellow areas - OBST AHEAD	

(1) *Depending on the aircraft position, when the TERR ON ND pb is set to ON, and the ARC or ROSE mode is selected, the ND displays both of the following:*
- *The terrain*

3. *The TAD and TCF functions operate with the use of the pure lateral GPS position. The FMS1 position provides the backup.*

If the FMGC detects low-navigation accuracy, then the enhanced modes of the EGPWS are automatically deactivated. The 5 GPWS modes remain active.

TERRAIN AWARENESS AND DISPLAY

Ident.: DSC-34-SURV-40-35-00001417.0002001 / 30 JUN 20
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855

The Terrain Awareness and Display (TAD) function computes a caution and a warning envelope in front of the aircraft, which varies according to aircraft altitude, nearest runway altitude, distance to the nearest runway threshold, ground speed, and turn rate. When the boundary of these envelopes conflicts with the terrain, memorized in the database, the system generates the relevant alert:

Alert Level	Aural Warning	ND (*Refer to DSC-31-45 Flags and Messages Displayed on ND*)	Local Warning
Warning	**TERRAIN AHEAD, PULL UP**	- Automatic terrain display See * - Solid red areas - TERR AHEAD (red)	The pb light comes on, on each pilot's instrument panel.
Caution	**TERRAIN AHEAD**	- Automatic terrain display pop up See * - Solid yellow areas - TERR AHEAD (amber)	

* When the TERR pb-sw ON, ND is selected ON, and ARC or ROSE mode is selected, the terrain is displayed on the ND. The terrain is displayed in various densities of green, yellow, red, or magenta, depending on the threat, (*Refer to DSC-31-45 Flags and Messages Displayed on ND*). If an alert is generated (caution or warning) when TERR pb-sw ON ND is not selected, the terrain will be automatically displayed and the ON light of the TERR pb-sw ON ND will come on.

Note:
1. *When TERR pb-sw ON ND is selected, the weather radar image is not displayed*
2. *The relative height of the aircraft is computed using the Captain's BARO setting. Thus, the Terrain Awareness Display (TAD) does not protect against BARO setting errors.*
3. *The TAD and Terrain Clearance Floor (TCF) functions operate using the FMS 1 position. Thus, the system does not protect against FMS 1 position error.*

If the crew identifies that navigation accuracy is low, it must set the enhanced modes to off, via the TERR pb-sw. The 5 GPWS modes remain active.

TERRAIN AWARENESS AND DISPLAY

Ident.: DSC-34-SURV-40-35-00001417.0108001 / 30 JUN 20
Applicable to: MSN 02014

The Terrain Awareness and Display (TAD) function computes a caution and a warning envelope in front of the aircraft, which varies according to aircraft altitude, nearest runway altitude, distance to the nearest runway threshold, ground speed, and turn rate. When the boundary of these envelopes conflicts with the terrain, memorized in the database, the system generates the relevant alert:

Alert Level	Aural Warning	ND (*Refer to DSC-31-45 Flags and Messages Displayed on ND*)	Local Warning
Warning	**TERRAIN TERRAIN, PULL UP**	- Automatic terrain display See * - Solid red areas - TERRAIN (red)	The pb light comes on, on each pilot's instrument panel.
Caution	**CAUTION TERRAIN**	- Automatic terrain display *See - Solid yellow areas - TERRAIN (amber)	

* When the TERR pb-sw ON, ND is selected ON, and ARC or ROSE mode is selected, the terrain is displayed on the ND. The terrain is displayed in various densities of green, yellow, red, or magenta, depending on the threat, (*Refer to DSC-31-45 Flags and Messages Displayed on ND*). If an alert is generated (caution or warning) when TERR pb-sw ON ND is not selected, the terrain will be automatically displayed and the ON light of the TERR pb-sw ON ND will come on.

Note:
1. *When TERR pb-sw ON ND is selected, the weather radar image is not displayed.*
2. *The Terrain Awareness Display (TAD) function computes the aircraft's relative altitude by using the Captain's BARO setting information. Therefore, if the BARO setting information is incorrect, the TAD function will also provide erroneous information and/or warnings*
3. *The TAD and Terrain Clearance Floor (TCF) functions use FMS 1 position information to perform their calculations. Therefore, in case of an FMS1 position error, the TAD and TCF will also provide erroneous information and/or warnings*

If the crew identifies that navigation accuracy is low, it must set the enhanced modes to off, via the TERR pb-sw. The 5 GPWS modes remain active.

TERRAIN AWARENESS AND DISPLAY

Ident.: DSC-34-SURV-40-35-00001417.0109001 / 30 JUN 20
Applicable to: MSN 02734

The Terrain Awareness and Display (TAD) function computes a caution and a warning envelope in front of the aircraft, which varies according to aircraft altitude, nearest runway altitude, distance to the nearest runway threshold, ground speed, and turn rate. When the boundary of these envelopes conflicts with the terrain, memorized in the database, the system generates the relevant alert:

Alert Level	Aural Warning	ND (*Refer to DSC-31-45 Flags and Messages Displayed on ND*)	Local Warning
Warning	**TERRAIN AHEAD, PULL UP**	- Automatic terrain display See * - Solid red areas - TERR AHEAD (red)	The pb light comes on, on each pilot's instrument panel.
Caution	**TERRAIN AHEAD**	- Automatic terrain display pop up See * - Solid yellow areas - TERR AHEAD (amber)	

* When the TERR pb-sw ON, ND is selected ON, and ARC or ROSE mode is selected, the terrain is displayed on the ND. The terrain is displayed in various densities of green, yellow, red, or magenta, depending on the threat, (*Refer to DSC-31-45 Flags and Messages Displayed on ND*). If an alert is generated (caution or warning) when TERR pb-sw ON ND is not selected, the terrain will be automatically displayed and the ON light of the TERR pb-sw ON ND will come on.

Note: 1. *When TERR pb-sw ON ND is selected, the weather radar image is not displayed.*
2. *The Geometric Altitude function can protect against certain BARO setting errors, provided the components used to compute the Geometric Altitude are sufficiently valid and accurate.*
3. *The TAD and Terrain Clearance Floor (TCF) functions use FMS 1 position information to perform their calculations. Therefore, in case of an FMS 1 position error, the TAD and TCF will also provide erroneous information and/or warnings.*

If the crew identifies that navigation accuracy is low, it must set the enhanced modes to off, via the TERR pb-sw. The 5 GPWS modes remain active.

TERRAIN AWARENESS AND DISPLAY

Ident.: DSC-34-SURV-40-35-00001417.0114001 / 30 JUN 20
Applicable to: MSN 06139, 06173

The Terrain Awareness and Display (TAD) function computes a caution and a warning envelope in front of the aircraft, depending on the aircraft altitude, the nearest runway altitude, the distance to the nearest runway threshold, the ground speed, and the turn rate. When the boundary of these envelopes conflicts with the terrain, or with an obstacle memorized in the database, the system generates the relevant alert:

Alert Level	Aural Warning	ND (*Refer to DSC-31-45 Flags and Messages Displayed on ND*)	Local Warning
Warning	**TERRAIN TERRAIN PULL UP**	- Automatic terrain display See * - Solid red areas - TERRAIN (red)	On each pilot's instrument panel, The pushbutton light comes on.
	OBSTACLE OBSTACLE, PULL UP	- Automatic terrain display See * - Solid red areas - OBST (red)	
Caution	**CAUTION TERRAIN**	- Automatic terrain displaySee * - Solid yellow areas - TERRAIN (amber)	
	CAUTION OBSTACLE	- Automatic terrain display See * - Solid yellow areas - OBST (amber)	

* When the TERR pb-sw ON ND is set to ON, and ARC or ROSE mode is selected, the ND displays the terrain and the obstacles memorized in the database, depending on the aircraft's position. The terrain is displayed in various densities of green, yellow, red, or magenta, depending on the threat, (*Refer to DSC-31-45 Flags and Messages Displayed on ND*). If an alert is generated (caution or warning), and TERR pb-sw ON ND is not selected, the terrain and the obstacles are automatically displayed, and the ON light of the TERR pb-sw ON ND comes on.

Note:
1. *When TERR pb-sw ON ND is selected, the weather radar image is not displayed.*
2. *The Geometric Altitude function can protect against certain BARO setting errors, provided the components used to compute the Geometric Altitude are valid and accurate enough.*
3. *The TAD and Terrain Clearance Floor (TCF) functions operate using the pure lateral GPS position and, the FMS1 position as backup.*

If the crew identifies that navigation accuracy is low, it must set the enhanced modes to off, via the TERR pb-sw. The 5 GPWS modes remain active.

TERRAIN CLEARANCE FLOOR

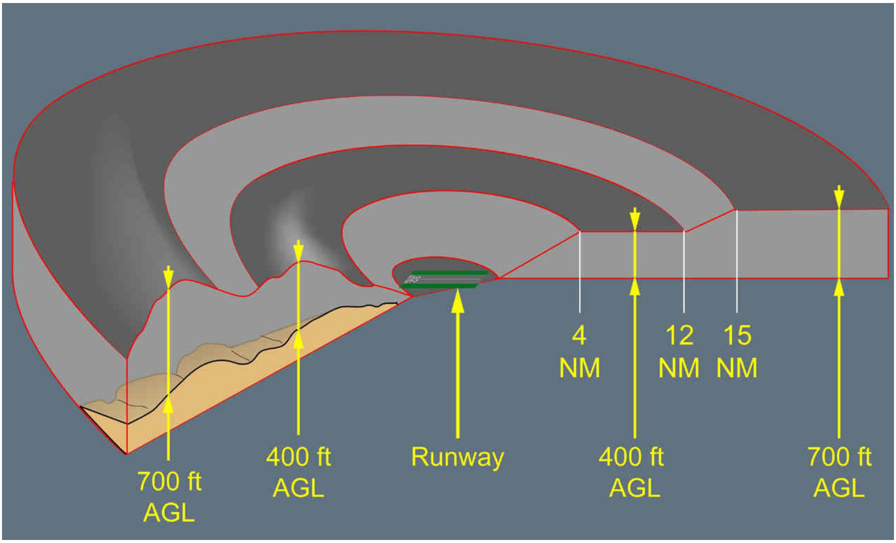
Ident.: DSC-34-SURV-40-35-00006162.0002001 / 28 MAY 20

3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

TERRAIN CLEARANCE FLOOR (TCF)

The TCF function computes a terrain clearance envelope around the airport runway. This function triggers an alert if the terrain clearance is not sufficient (even when the aircraft is in landing configuration). This function provides an enhanced GPWS mode 4.
The TCF function also protects against an attempt to land where there is no airfield.
The TAWS database includes the applicable TCF envelope for each airport runway that has terrain data, and that is longer than 3 500 ft.
The TCF function is active during all the following flight phases: Takeoff, cruise and approach.

TCF Envelope



If the aircraft descends below the protection envelope, both of the following alerts are triggered:

- The “TOO LOW TERRAIN” aural alert, if the aircraft enters the envelope
  L2 If the aircraft continues to descend below the envelope, the alert is triggered one time for every 20 % degradation in radio altitude
- L1 The TOO LOW TERRAIN visual alert on the PFD.

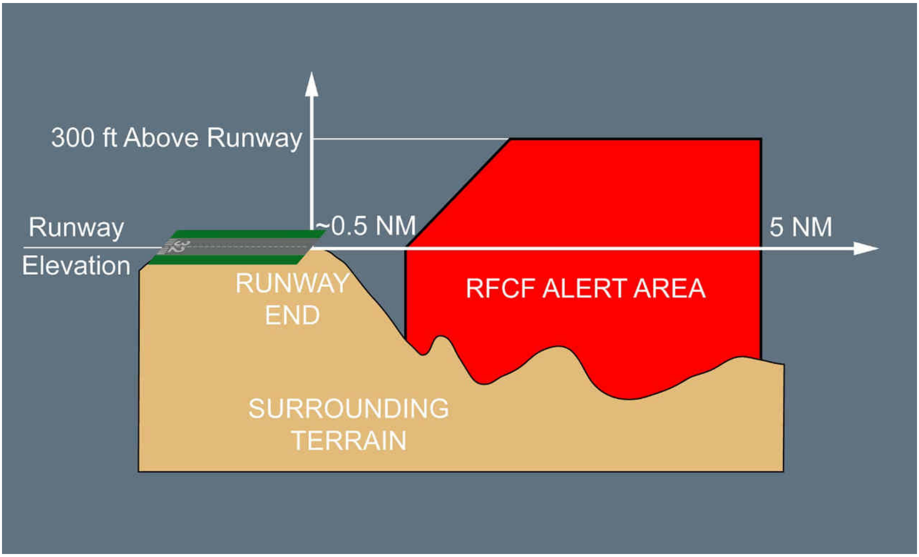
RUNWAY FIELD CLEARANCE FLOOR

Ident.: DSC-34-SURV-40-35-00006163.0002001 / 28 MAY 20

4 **Applicable to: MSN 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The Runway Field Clearance Floor (RFCF) provides an additional protection envelope for runways that are at an elevation that is significantly more than the surrounding terrain.
The envelope is a circular band that starts within a specific distance of the runway. The width of this circular band depends on the runway. The envelope is based on both the geometric altitude and the runway elevation.
If the aircraft descends below this protection envelope, the "TOO LOW TERRAIN" aural and visual alerts are triggered.

RFCF



RUNWAY AWARENESS AND ADVISORY SYSTEM

Ident.: DSC-34-SURV-40-35-00013214.0001001 / 17 MAR 11

5 **Applicable to: MSN 08495-09324, 10949-11597**

The Runway Awareness and Advisory System (RAAS) enhances the flight crew’s awareness of the aircraft position on ground. The RAAS uses the EGPWS to trigger aural alerts in the three following cases:

- Approaching the runway: When the aircraft is within a specific distance from the runway, e.g. “Approaching three four left”.
  If the aircraft is within a specific distance from more than one runway, the “Approaching runways” aural alert is triggered
- On the runway: When the aircraft enters a runway and the aircraft heading aligns with the runway direction, e.g. “On runway three four left”
- Takeoff from the taxiway: When the aircraft speed exceeds 40 kt, while the aircraft is not on a runway, the “On taxiway! On taxiway!” aural alert is triggered.

GENERAL

Ident.: DSC-34-SURV-40-35-00006159.0003001 / 13 JAN 14
Applicable to: MSN 04827-04860

The GPWS system :
- Correlates the current aircraft position to terrain (and obstacle ◁) and airport database.
- Computes a caution and a warning envelope ahead of the aircraft. This includes the determination of the climb prediction envelope for terrain (and obstacle ◁) avoidance, using the modelized climb capability of the aircraft.
- Displays the terrain (and obstacle ◁) hazards along the projected flight path ahead of the aircraft.
- Generates alerts described below.

While the predictive GPWS functions are operative, the basic GPWS Mode 2 is inhibited.
If the predictive GPWS functions fail or if there is significant difference between the radio height and the altitude computed by the T3CAS, the basic GPWS Mode 2 is reactivated.

ALERTS

Ident.: DSC-34-SURV-40-35-00006160.0014001 / 30 JUN 20
Applicable to: MSN 04827-04860

THE FOLLOWING TABLE PROVIDES THE RELEVANT WARNING AND CAUTION ALERTS

Alert Level	Aural alert	ND (*Refer to DSC-31-45 GPWS (EGPWS)*)	Local alert
Warning	**TERRAIN AHEAD, PULL UP**	- Automatic terrain display ⁽¹⁾ - Solid red areas - TERR AHEAD (red)	The GPWS/PULL UP pb light comes on, on each pilot's instrument panel.
	OBSTACLE AHEAD, PULL UP	- Automatic obstacle display ⁽¹⁾ - Solid red areas - OBST AHEAD (red)	
	AVOID TERRAIN	- Automatic terrain display ⁽¹⁾ - Red/black crosshatched areas - TERR AHEAD (red)	
	AVOID OBSTACLE	- Automatic obstacle display ⁽¹⁾ - Red/black crosshatched areas - OBST AHEAD (red)	

Continued on the following page

Continued from the previous page

Alert Level	Aural alert	ND (*Refer to DSC-31-45 GPWS (EGPWS)*)	Local alert
Caution	**TERRAIN AHEAD**	- Automatic terrain display *(1)* - Solid yellow areas - TERR AHEAD (Amber)	The GPWS light of the GPWS/PULL UP pb comes on, on each pilot's instrument panel.
	OBSTACLE AHEAD ◁	- Automatic obstacle display *(1)* - Solid yellow areas - OBST AHEAD (Amber) ◁	
	TOO LOW TERRAIN	NIL	

*(1) When the TERR ON ND pb is set to ON, and ARC or ROSE mode is selected, the ND displays the terrain (and obstacle ◁) memorized in the database, depending on the aircraft's position. The terrain (and obstacle ◁) are displayed in various densities of green, yellow, red, or magenta, depending on the threat, (*Refer to DSC-31-45 Flags and Messages Displayed on ND*). If an alert is generated (caution or warning), and TERR ON ND is not selected, the terrain (and obstacle ◁) are automatically displayed, and the ON light of the TERR ON ND pb comes on.*

In case of low accuracy of the aircraft position computed by the FMGC, the predictive functions of the GPWS are automatically deactivated. The 5 GPWS basic modes remain active.

ALERTS ENVELOPES

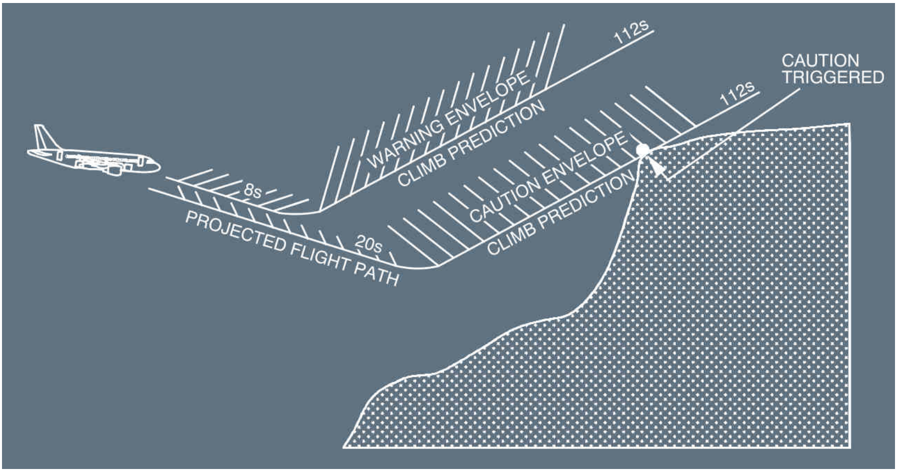
Applicable to: MSN 04827-04860

VERTICAL ENVELOPE



CAUTION ENVELOPE

The caution envelope extends along the flight path, from a distance of 20 s in front of the aircraft, to a constructed climb path, at a distance of 132 s in front of the aircraft.

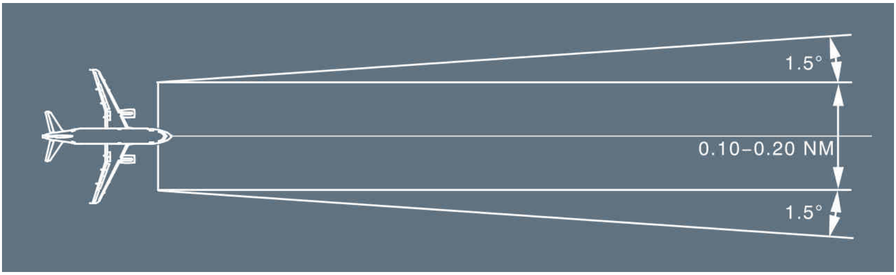
If there is a conflict between the terrain caution envelope and the terrain data stored in the database, one of the following cautions is triggered:
- A “TERRAIN AHEAD” caution, if the terrain conflict is ahead of the aircraft.
- A “TOO LOW TERRAIN” caution, if the terrain conflict is below the aircraft, instead of ahead of the aircraft.

WARNING ENVELOPE

The warning envelope extends along the flight path, from a distance of 8 s in front of the aircraft, to a constructed climb path, at a distance of 120 s in front of the aircraft.
In a Mountainous Approach Area (MAA: Existence of terrain more than 2 000 ft above the runway and within 6 NM of this runway), this distance is linearly reduced to 30 s, to prevent nuisance alerts during low altitude maneuvers.

If there is a conflict between the terrain warning envelope ahead of the aircraft, and the terrain data stored in the database, one of the following warnings is triggered:
- A “TERRAIN AHEAD-PULL UP” warning, if the aircraft can climb over the terrain.
- An “AVOID TERRAIN” warning, if the aircraft cannot climb over the terrain with sufficient safety margin.

HORIZONTAL ENVELOPE



During turns, the sensor opens up into turns to determine if there are possible terrain conflicts (up to 90 °).

RUNWAY CONVERGENCE CRITERIA

When the aircraft enters the approach sector (approximately 2.7 NM or 5 km from the runway threshold), the system computes runway convergence criteria in order to inhibit the Terrain Awareness and Warning System (TAWS) predictive alerts. For more information on the inhibition logic of the T3CAS. *Refer to DSC-34-SURV-40-35 Inhibition Logic of the GPWS Predictive Functions in Approach*

INHIBITION LOGIC OF THE GPWS PREDICTIVE FUNCTIONS IN APPROACH

Ident.: DSC-34-SURV-40-35-00013669.0002001 / 17 MAR 17
Applicable to: MSN 04827-04860

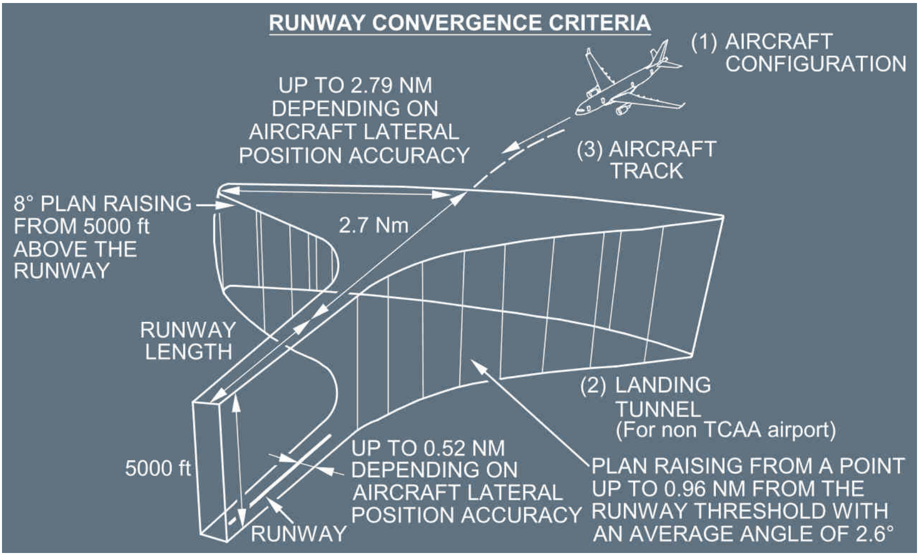
In approach, as the aircraft is flying towards the ground, the runway convergence criteria will inhibit the Ground Proximity Warning System (GPWS) predictive functions. Therefore, depending on the convergence criterion, GPWS alert may not be triggered in the landing tunnel described below, even close to terrain.

The main runway convergence criteria are the following:
- (1) Aircraft flaps/landing gear configuration,
- (2) Aircraft horizontal and vertical position from the runway threshold (landing tunnel criterion),
- (3) Aircraft track (convergence criterion).

The airports stored in the terrain database are split into two categories:

- Airport flagged as Terrain Challenging Airport Area (TCAA),
- Airport not TCAA flagged.

For TCAA flagged airports, the shape and dimensions of the landing tunnel are tailored to each TCAA airport while for non TCAA airports the landing tunnel shape and dimensions are described below.



RUNWAY CONVERGENCE CRITERIA
(1) AIRCRAFT CONFIGURATION
UP TO 2.79 NM DEPENDING ON AIRCRAFT LATERAL POSITION ACCURACY
(3) AIRCRAFT TRACK

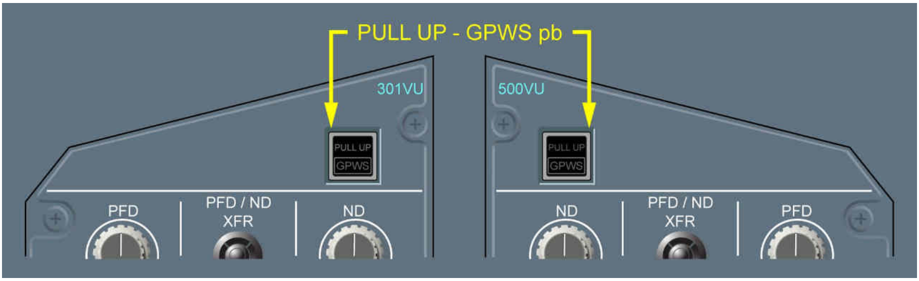
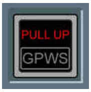
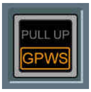
3 **Applicable to: MSN 04827-04860, 06409-09324, 10949-11597**



PULL UP – GPWS pb

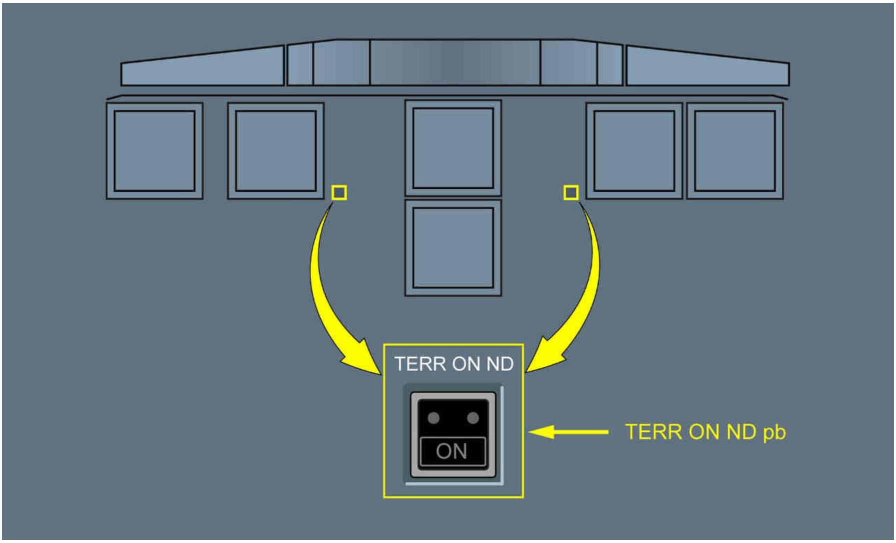


Comes on when the second boundary of mode 1 is penetrated or when the mode 2 is activated.
A “PULL UP” or “TERRAIN - TERRAIN PULL UP” aural alert is associated.



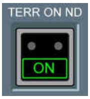
Comes on when any other mode is activated. It is associated with a corresponding aural alert.

Note:
1. *If the flight crew briefly presses the PULL UP – GPWS pb when mode 5 alert is heard, the GPWS light goes off and the aural alert stops.*
2. *On the ground only, the flight crew presses this pb to test the GPWS.*



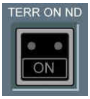
TERR ON ND pb

These pbs are on both sides of the ECAM. Each pb controls the onside terrain display.



The terrain appears on the ND if all of the following apply:
- TERR ON ND pb-sw is set to ON
- TERR FAULT light is not on
- TERR STBY ECAM memo does not appear
- The FMGS navigation accuracy is high.

The ON light comes on.



The terrain data does not appear on the ND.

Note: 1. *If the predictive functions of the GPWS generate a caution or a warning, while the TERR ON ND pb is off, the terrain automatically appears on the NDs and the ON light of the TERR ON ND pb comes on.*
2. *To be able to identify the difference between the terrain and the weather display, the terrain display goes from the center outward to both sides of the ND.*
3. *The terrain and obstacles image appears on the ND if:*
   - *The aircraft is within 2 000 ft above the terrain, and*
   - *The TERR ON ND pb is passed, or automatically, in case of terrain caution(warning) alerts*

   Depending on the capacity of the TAWS system installed (e.g. with Eleview or Peaks functions), the terrain can display the highest and lowest geographic terrain elevations for the selected ND range. The terrain can also increase situation awareness, regardless of the aircraft altitude.

   If the terrain(obstacle) image is being automatically displayed on the ND, if the flight crew presses the TERR ON ND pb, the terrain(obstacle) image no longer appears.

INSTRUMENT PANELS

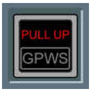
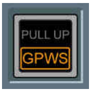
PULL UP – GPWS pb

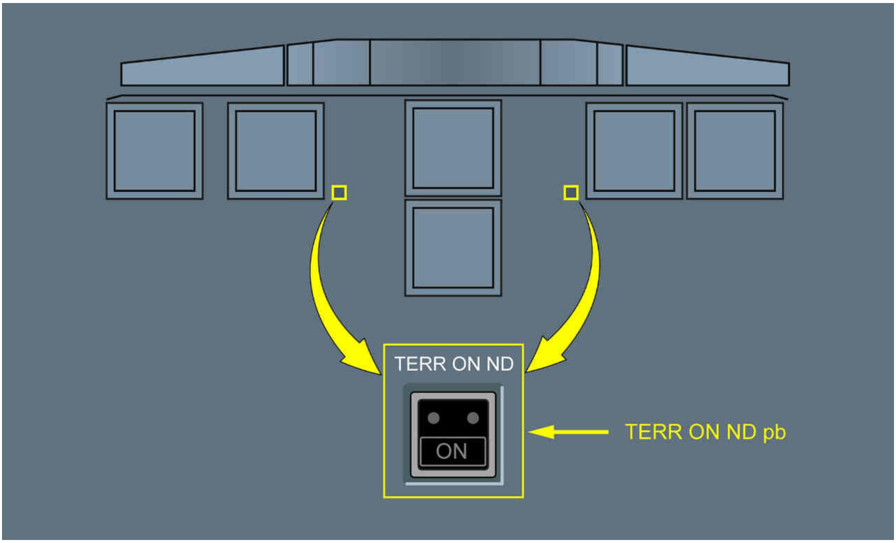


Comes on to give a visual indication, when a PULL UP warning is triggered in modes 1, 2, and TAD. The corresponding aural alert sounds.



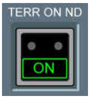
Comes on when any other mode is activated.
The corresponding aural alert sounds.

Note: *1. If the flight crew briefly presses this button when one of these modes is activated, the GPWS light goes off and the aural alert stops.*
2. On the ground, the flight crew presses this pb to test the GPWS. If the flight crew briefly presses this pb, some of the aural alerts sound and the pb captions, associated with the GPWS come on. If the flight crew continuously presses this pb, all the aural alerts sound.



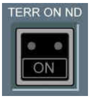
TERR ON ND pb

These pb are on both sides of the ECAM. Each pb controls the onside terrain display.



The terrain appears on the ND if both of the following apply:
- TERR ON ND pb-sw is set to ON
- TERR FAULT light is not on.

The ON light comes on.



The terrain data does not appear on the ND.

Note: *1. If the TAD mode generates a caution or a warning while the TERR ON ND pb is off, the terrain automatically appears on the NDs. In addition, the ON light of the TERR ON ND pb will come on.*
2. To be able to identify the difference between the terrain and the weather display, the terrain display goes from the center outward to both sides of the ND.
3. The terrain and obstacles image appears on the ND if:
- *The aircraft is within 2 000 ft above the terrain, and*
- *The TERR ON ND pb is passed, or automatically, in case of terrain caution(warning) alerts*

Depending on the capacity of the TAWS system installed (e.g. with Eleview or Peaks functions), the terrain can display the highest and lowest geographic terrain elevations for the selected ND range. The terrain can also increase situation awareness, regardless of the aircraft altitude.

If the terrain(obstacle) image is being automatically displayed on the ND, if the flight crew presses the TERR ON ND pb, the terrain(obstacle) image no longer appears.

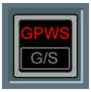
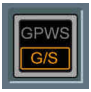
GPWS – G/S pb

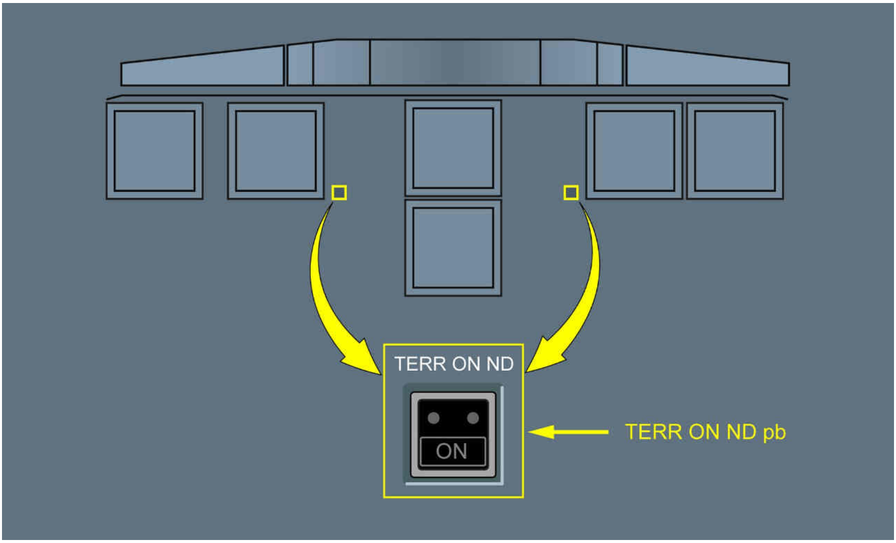


Comes on when any mode from 1 to 4, or any TAD, or TCF alert is activated. A specific aural alert is associated.



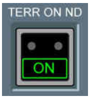
Comes on when mode 5 is activated. It is associated with the aural “GLIDE SLOPE” alert.

Note:
1. *If the flight crew briefly presses the GPWS – G/S pb when a GLIDE SLOPE warning is triggered, the G/S light goes off and the "GLIDE SLOPE" aural alert stops.*
2. *On the ground, the flight crew presses this pb to test the GPWS. If the flight crew briefly presses this pb, some of the aural alerts sound and the pb captions, associated with the GPWS come on. If the flight crew continuously presses this pb, all the aural alerts sound.*



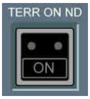
TERR ON ND pb

These pbs are on both sides of the ECAM. Each pb controls the onside terrain display.



The terrain appears on the ND if both of the following apply:
- TERR ON ND pb is set to ON
- TERR FAULT light is not on.

The ON light comes on.



The terrain data does not appear on the ND.

Note: 1. *If the TAD mode generates a caution or a warning while the TERR ON ND pb is off, the terrain automatically appears on the NDs. In addition, the ON light of the TERR ON ND pb will come on.*
2. *To be able to identify the difference between the terrain and the weather display, the terrain display goes from the center outward to both sides of the ND.*
3. *The terrain and obstacles image appears on the ND if:*
   - *The aircraft is within 2 000 ft above the terrain, and*
   - *The TERR ON ND pb is passed, or automatically, in case of terrain caution(warning) alerts*

Depending on the capacity of the TAWS system installed (e.g. with Eleview or Peaks functions), the terrain can display the highest and lowest geographic terrain elevations for the selected ND range. The terrain can also increase situation awareness, regardless of the aircraft altitude.

If the terrain(obstacle) image is being automatically displayed on the ND, if the flight crew presses the TERR ON ND pb, the terrain(obstacle) image no longer appears.

MEMO DISPLAY

Ident.: DSC-34-SURV-40-40-A-00017057.0001001 / 21 MAR 16
Applicable to: ALL

GPWS FLAP 3 : This memo appears in green when GPWS LDG FLAP 3 pb-sw is ON.

Ident.: DSC-34-SURV-40-40-A-00017058.0001001 / 21 MAR 16
Applicable to: ALL

GPWS FLAP MODE OFF : This memo appears in green when GPWS FLAP MODE pb-sw is OFF.

Ident.: DSC-34-SURV-40-40-A-00017060.0004001 / 21 MAR 16
Applicable to: ALL

The TERR OFF memo appears when the TERR pb-sw is OFF.

TERR OFF : This memo appears in green when:
- The aircraft is in flight phase 2, before the Take Off Configuration test is launched.
- The aircraft is in flight phase 6.

TERR OFF : This memo appears in amber when:
- The aircraft is in flight phase 2, after the Take Off Configuration test.
- The aircraft is in flight phases 3, 4, 5, 7, 8 and 9.

Ident.: DSC-34-SURV-40-40-A-00017059.0007001 / 21 MAR 16

Applicable to: MSN 02321, 02887-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-06173

TERR STBY : Airborne TERR STBY memo appears in green when the aircraft position accuracy (computed by the EGPWS) is not sufficient to allow the enhanced TCF and TAD modes to operate. These modes are not available until the TERR STBY memo disappears. If selected, the terrain data display on ND is automatically deselected when the TERR STBY memo is triggered.

Ident.: DSC-34-SURV-40-40-A-00017059.0004001 / 21 MAR 16

4 **Applicable to: MSN 04827-04860, 06409-09324, 10949-11597**

TERR STBY : This memo appears in green when any required predictive function input is missing or considered invalid. The predictive functions are not available, until the TERR STBY memo disappears. If selected, the terrain data display on the ND is automatically deselected when the TERR STBY memo is triggered.

Ident.: DSC-34-SURV-40-40-A-00017059.0003001 / 21 MAR 16

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014, 02734

TERR STBY : Airborne TERR STBY memo appears in green when the aircraft position accuracy (provided by the FMS) is not sufficient to allow the enhanced TCF and TAD modes to operate. These modes are not available until the TERR STBY memo disappears. If selected, the terrain data display on ND is automatically deselected when the TERR STBY memo is triggered.

GENERAL

Ident.: DSC-34-SURV-50-10-00015123.0001001 / 28 MAY 20

1 **Applicable to: MSN 08495-09324, 10949-11597**

The ROPS is designed to alert the flight crew in the case of potential runway overrun situation for dry and wet runway. The ROPS is composed of two functions:

- The ROW function. It automatically arms at 400 ft AGL and works until start of braking,
- The ROP function. It works from start of braking until the aircraft stops.

Intentionally left blank

DESCRIPTION

Ident.: DSC-34-SURV-50-20-00015124.0008001 / 03 NOV 22

1 **Applicable to: MSN 10949-11597**

The ROW/ROP functions compute both the wet and dry landing distances for the current conditions. The system then compares these values with the LDA of the landing runway. To detect the landing runway, the ROW/ROP functions use the TAWS runway database and the current aircraft position and track. During final approach:

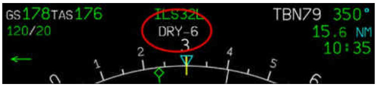
- The detection starts from 2 000 ft, then
- The ROW function arms at 400 ft.

L2 The landing runway detection is continuously updated several times per second, including below 400 ft when the ROW function is armed.

L1 The computation occurs in real time, the ROW and ROP functions consider:

- All landing weight and CG ranges (this includes overweight landing)
- Both landing configurations (CONF 3 and CONF FULL)
- LDA
- All wind conditions
- Dry and wet runway conditions
- No failure that affects landing performance
- 15 % safety margin.

The flight crew uses the runway condition selector to set the runway condition to WET or DRY (*Refer to DSC-34-SURV-50-30 Controls and Indicators*).
The ND indicates the runway condition selected:



- Nominal display:

- A box appears for 3 s after selection change:

If a risk of overrun is detected (computed landing distances are more than the LDA) the ROW/ROP triggers:

- Visual alert messages displayed on the PFDs
- Aural alert messages provided through loudspeakers.

ROW FUNCTION

The ROW function provides enhanced flight crew awareness about the approach stabilization and the capability to land on available landing distance.

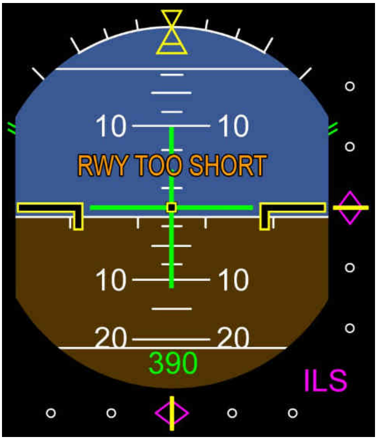
ROW ARMING

During the approach, the ROW function detects the landing runway according to the aircraft position, and the TAWS runway database.
At 400 ft AGL, the ROW function automatically arms, and starts to compute both the wet and dry landing distances, depending on flight crew selection.

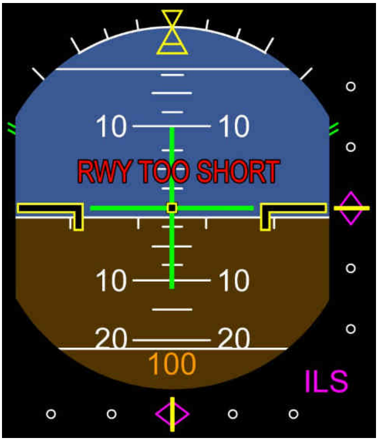
The ROW function computes the landing distance with the following assumptions:
- Maximum manual brake pressure
- Idle reverser thrust for the computation for dry runway
- Maximum reverser thrust for the computation for wet runway.

ROW ACTIVATION

Below 400 ft, if the computation for landing distance is more than the LDA:
- The RWY TOO SHORT message is displayed on both PFDs. This message flashes for 9 s and then remains steady. This message is not associated with an aural alert.



Below 200 ft, if the computation for landing distance is more than the LDA:
- The RWY TOO SHORT message is displayed on both PFDs. This message flashes for 9 s and then remains steady. In addition, a repetitive aural alert “RUNWAY TOO SHORT” triggers.



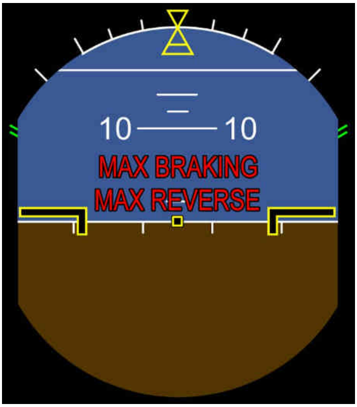
When the landing distance computation is less than the LDA, the alerts stop.

ROP FUNCTION

The ROP function provides enhanced flight crew awareness about the deceleration and capability to stop before the end of the runway.

ROP ACTIVATION

On ground, the ROP function computes the braking distance for the current aircraft and runway conditions. If current braking performance is not sufficient to stop on LDA, it triggers visual and aural alerts.
As soon as an overrun situation is detected MAX BRAKING and MAX REVERSE messages are displayed on both PFDs. They flash for 9 s and then remain steady.



At the same time, the aural alert “BRAKE, MAX BRAKING, MAX BRAKING’’ is triggered and continues until the system detects maximum manual brake pressure.
When the flight crew applies maximum manual brake pressure, the aural alert “SET MAX REVERSE” is triggered and continues until the system detects maximum reverse thrust.

Note: *The aural alert “BRAKE, MAX BRAKING, MAX BRAKING” has priority over “SET MAX REVERSE”.*

Below 80 kt, the aural alert “KEEP MAX REVERSE” is triggered, if the system still detects overrun situation with maximum manual brake pressure and maximum reverse thrust.
If the overrun situation is no longer detected, alerts are no longer triggered.

ROW/ROP INHIBITION

The flight crew can use the ROW/ROP pb-sw to inhibit the ROW/ROP function (*Refer to DSC-34-SURV-50-30 Controls and Indicators*).
In this case, the ROW and ROP functions are fully inhibited:

- No message displayed on the PFD
- No audio alert
- No runway condition displayed on the ND
- ROW/ROP runway condition selector inhibited.

In any case, the ROP function is inhibited when the ground speed decreases below 30 kt.

OPERATING PROCEDURES

For operating procedure related to ROW/ROP (*Refer to FCTM/ROW/ROP*).

DESCRIPTION

Ident.: DSC-34-SURV-50-20-00015124.0005001 / 03 NOV 22
Applicable to: MSN 08495-09324

The ROW/ROP functions compute both the wet and dry landing distances for the current conditions. The system then compares these values with the LDA of the landing runway. To detect the landing runway, the ROW/ROP functions use the TAWS runway database and the current aircraft position and track. During final approach:

- The detection starts from 2 000 ft, then
- The ROW function arms at 400 ft.

L2 The landing runway detection is continuously updated several times per second, including below 400 ft when the ROW function is armed.

L1 The computation occurs in real time, the ROW and ROP functions consider:
- All landing weight and CG ranges (this includes overweight landing)
- Both landing configurations (CONF 3 and CONF FULL)
- LDA
- All wind conditions
- Dry and wet runway conditions
- No failure that affects landing performance
- 15 % safety margin.

If a risk of overrun is detected (computed landing distances are more than the LDA) the ROW/ROP triggers:
- Visual alert messages displayed on the PFDs
- Aural alert messages provided through loudspeakers.

ROW FUNCTION

The ROW function provides enhanced flight crew awareness about the approach stabilization and the capacity to land on available landing distance.

ROW ARMING

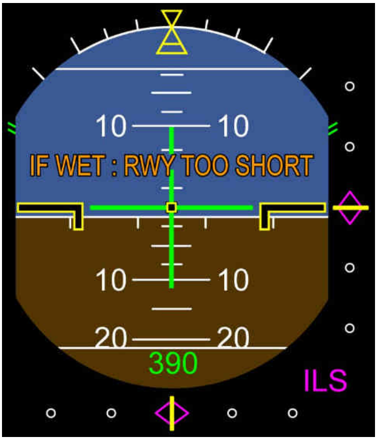
During the approach, the ROW function detects the landing runway according to the aircraft position, and the TAWS runway database.
At 400 ft AGL, the ROW function automatically arms, and starts to compute both the wet and dry landing distances for current aircraft and environmental conditions.

The ROW function computes the landing distance with the following assumptions:
- Maximum manual brake pressure
- Idle reverser thrust for the computation for dry runway
- Maximum reverser thrust for the computation for wet runway.

ROW ACTIVATION

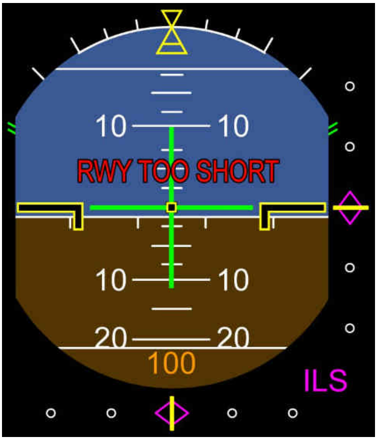
Below 400 ft, if the computation for wet landing distance is more than the LDA:

- The IF WET: RWY TOO SHORT message is displayed on both PFDs. This message flashes for 9 s and then remains steady. This message is not associated with an aural alert.



Below 200 ft, if the computation of the dry landing distance is more than the LDA:

- The RWY TOO SHORT message is displayed on both PFDs. This message flashes for 9 s and then remains steady. In addition, a repetitive aural alert “RUNWAY TOO SHORT” triggers.



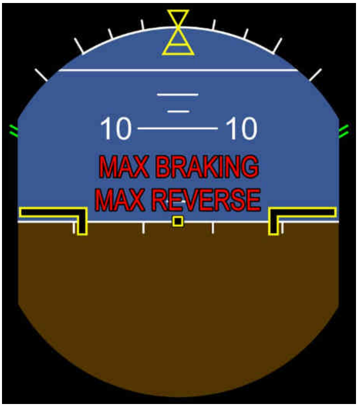
When the landing distance computation is less than the LDA, the alerts stop.

ROP FUNCTION

The ROP function provides enhanced flight crew awareness about the deceleration and capability to stop before the end of the runway.

ROP ACTIVATION

On ground, the ROP function computes the braking distance for the current aircraft and runway conditions. If current braking performance is not sufficient to stop on LDA, it triggers visual and aural alerts.
As soon as an overrun situation is detected MAX BRAKING and MAX REVERSE messages are displayed on both PFDs. They flash for 9 s and then remain steady.



At the same time, the aural alert “BRAKE, MAX BRAKING, MAX BRAKING” is triggered and continues until the system detects maximum manual brake pressure.
When the flight crew applies maximum manual brake pressure, the aural alert “SET MAX REVERSE” is triggered and continues until the system detects maximum reverse thrust.

Note: *The aural alert “BRAKE, MAX BRAKING, MAX BRAKING” has priority over “SET MAX REVERSE”.*

Below 80 kt, the aural alert “KEEP MAX REVERSE” is triggered, if the system still detects overrun situation with maximum manual brake pressure and maximum reverse thrust.
If the overrun situation is no longer detected, alerts are no longer triggered.

ROP INHIBITION

The ROP function is inhibited when the ground speed decreases below 30 kt.

OPERATING PROCEDURES

For operating procedure related to ROW/ROP (*Refer to FCTM/ROW/ROP*).

OVERVIEW

Ident.: DSC-34-SURV-60-10-00020407.0001001 / 21 MAR 17
Applicable to: ALL

The Traffic alert and Collision Avoidance System (TCAS):

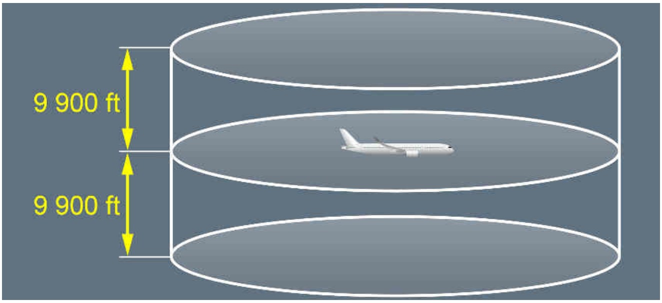
- Detects and displays surrounding aircraft that have a transponder
- Calculates and display possible collision threats
- Triggers vertical speed orders, in order to avoid collisions.

PRINCIPLE

Ident.: DSC-34-SURV-60-10-00020408.0001001 / 05 JUN 18
Applicable to: ALL

The TCAS detection capability is limited to intruders flying within a maximum range of 30 NM on either sides and approximately 30 NM to 80 NM longitudinally (depending on aircraft configuration and external conditions), and within a maximum altitude range of 9 900 ft above and below the aircraft.

TCAS Range

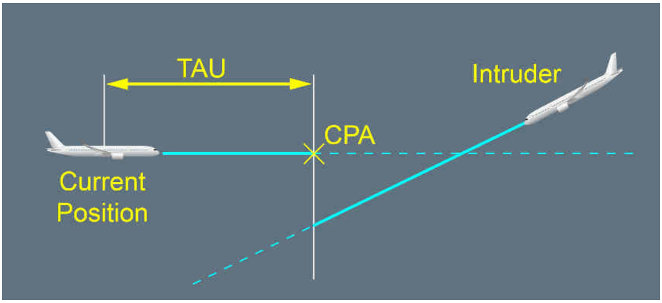


The TCAS obtains data transmitted by the transponders of nearby aircraft, and uses this data to evaluate possible collision threats.

The TCAS determines:
- The bearing of intruders, in relation to the bearing of the aircraft.
- The distance between the aircraft and intruders, and the rate of separation or closure.
- The relative altitude of intruders, if intruders report their altitude via a Mode-C or Mode-S transponder.

The TCAS then calculates the intruder trajectory, the Closest Point of Approach (CPA), and the estimated time (TAU) before reaching the CPA.
The TAU is the ratio between the distance that separates both aircraft, and the sum of their speed.

TAU Definition



If the TCAS detects that the trajectory of an intruder may be a collision threat, it triggers:
- Audio and visual indicators
- Vertical speed orders, to ensure a sufficient trajectory separation and a minimal vertical speed variation considering all intruders.

MAIN COMPONENTS

Ident.: DSC-34-SURV-60-10-00020409.0001001 / 21 MAR 17

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**

The system includes:
- A single channel TCAS computer
- Two TCAS antennas
- Two mode S ATC transponders, one active the other in standby

  These transponders allow:
  - Interface between the ATC/TCAS control panel and the TCAS computer
  - Communication between the aircraft and intruders equipped with a TCAS system.
- An ATC/TCAS control panel.

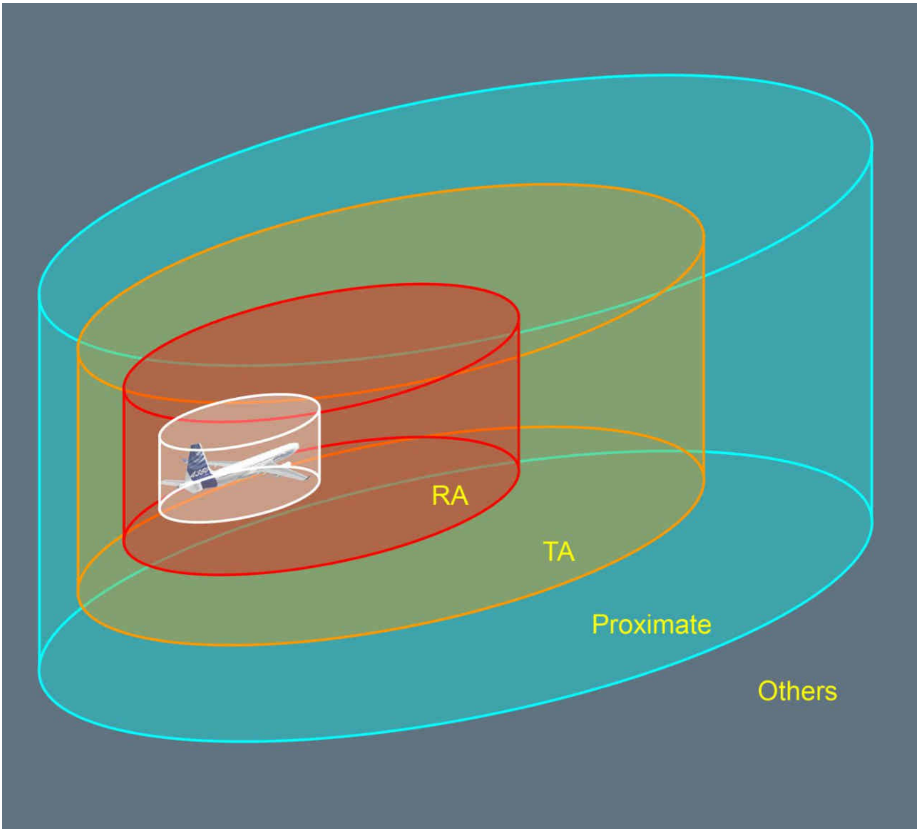
INTRUDER DETECTION CATEGORIES

Ident.: DSC-34-SURV-60-10-00020410.0001001 / 28 NOV 19
Applicable to: ALL

The TCAS divides the space surrounding the aircraft into the following four zones, in order to evaluate and categorize possible collision threats:
- Resolution Advisory (RA)
- Traffic Advisory (TA)
- Proximate intruders
- Other intruders.

TCAS Envelopes



Depending on the level of the collision threat, the TCAS triggers audio and visual indicators::

LEVEL	INTRUDER POSITION	DISPLAYED INFORMATION AND MESSAGE	
Other intruders	- No collision threat - Any non proximate, TA, RA within the surveillance envelope (lateral range: Closer than 30 NM)	- ND: Intruder position	Proximate	- No collision threat - Intruder in the vicinity of the A/C (closer than 6 NM laterally and ±1200 ft vertically)	- ND: Intruder position	Traffic Advisory (TA)	- Potential collision threat - TAU is about 40 s	- ND: Intruder position - Aural messages	Resolution Advisory (RA)	- Real collision threat - TAU is about 25 s	- ND: Intruder position - Aural messages - PFD: Vertical orders • Maintain actual V/S (Preventive Advisory) or • Modify V/S (Corrective Advisory)	
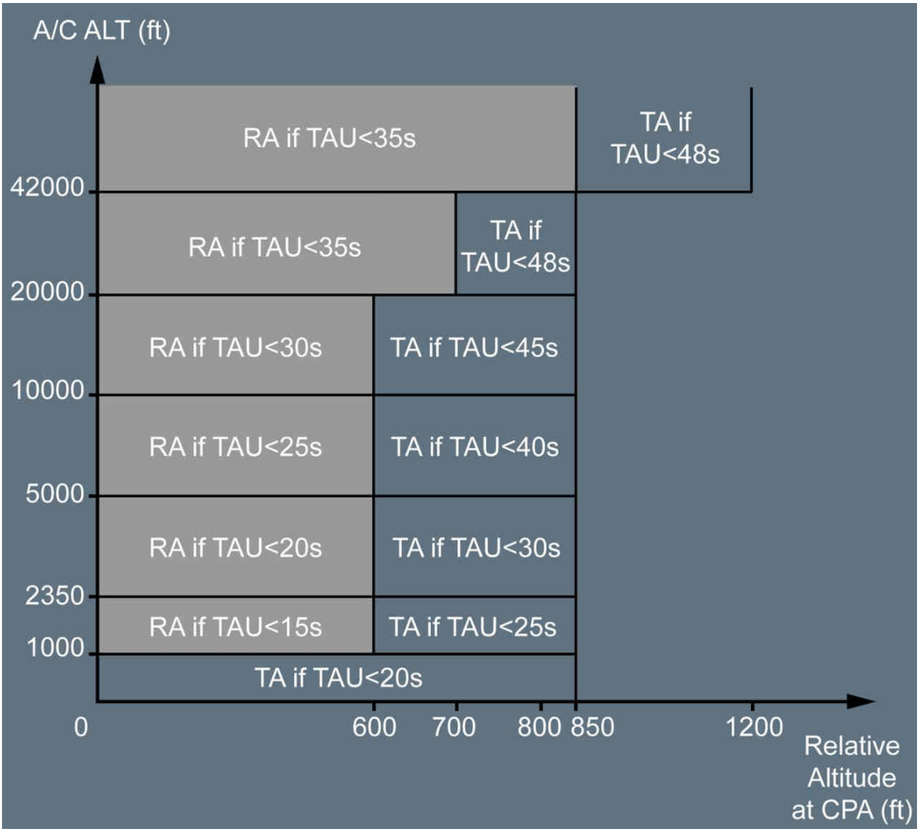
TA/RA thresholds



TCAS MODES

Ident.: DSC-34-SURV-60-10-10-00020411.0001001 / 21 MAR 17

3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**

TCAS MODES

The TCAS has three different modes of operations that can be selected on the ATC / TCAS control panel:

- The Traffic Advisory/Resolution Advisory (TA/RA) mode
- The Traffic Advisory Only (TA ONLY) mode
- The standby (STBY) mode.

4 Ident.: DSC-34-SURV-60-10-10-00020411.0002001 / 25 MAY 20

Applicable to: MSN 11482-11597

TCAS MODES

The TCAS has three different modes of operations that can be selected on each of the two RMPs of the center pedestal (and on the third RMP ◁).

- The Traffic Advisory/Resolution Advisory (TA/RA) mode
- The Traffic Advisory Only (TA ONLY) mode
- The standby (STBY) mode.

Ident.: DSC-34-SURV-60-10-10-00020412.0001001 / 21 MAR 17

Applicable to: ALL

TRAFFIC ADVISORY/RESOLUTION ADVISORY (TA/RA) MODE

The TA/RA mode is the normal TCAS operating mode that enables:

- The ND to display all intruders
- The PFD to display the vertical speed orders that indicate the vertical direction that the aircraft should take, in order to avoid a collision.

Ident.: DSC-34-SURV-60-10-10-00020413.0001001 / 21 MAR 17
Applicable to: ALL

TRAFFIC ADVISORY ONLY (TA ONLY) MODE

The TA ONLY mode can be selected:

- Manually in case of aircraft degraded performance (engine failure, landing gear extended), or in specific airports, and for specific procedures (identified by operators) that may provide RA that are neither wanted nor appropriate (e.g. closely-spaced parallel or converging runways)
- Automatically, if TA/RA mode is previously selected and:
  - The windshear alert is triggered
  - The stall warning is triggered
  - GPWS alerts are triggered
  - Aircraft is below 1 000 ft AGL.

When the TCAS is operating in TA ONLY mode:

- All RAs are inhibited and converted into TAs
- TA threshold is set to TAU ≤20 s, irrespective of the aircraft altitude
- No vertical speed advisories are indicated on the PFDs
- “TA ONLY” is displayed on the NDs

Ident.: DSC-34-SURV-60-10-10-00020414.0001001 / 21 MAR 17
Applicable to: ALL

STANDBY MODE

In the standby mode, the advisory generation and surveillance functions are not active. The TCAS does not trigger any alert. No TCAS information can be displayed on the PFDs and NDs.

AP/FD TCAS

Ident.: DSC-34-SURV-60-10-00020415.0002001 / 18 MAY 22
5 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

MODE

The AP/FD TCAS mode is a vertical guidance mode of the AP/FD. In the case the TCAS generates a Resolution Advisory (RA) alert, this mode automatically engages to assist the flight crew to follow the RA orders, and to revert toward initial trajectory:

- Automatically if the AP is engaged, or
- Manually with the guidance of the Flight Director (FD), if the AP is not engaged.

The AP/FD TCAS mode optimizes the vertical speed for a rapid and appropriate response to an RA, and minimizes the deviations from the latest ATC clearance.
When the TCAS is operating in TA ONLY mode, the AP/FD TCAS mode is inhibited.

INTRUDER DETECTION

Based on the received information from the intruders, the TCAS may generate the following sequence of alerts:

- **If the TCAS considers the intruder to be a possible collision threat**
  - It generates a visual and aural Traffic Advisory (TA).
  - In that case, the AP/FD TCAS mode automatically arms: TCAS appears on the FMA to inform the flight crew that the AP/FD TCAS mode will be available in the case a Resolution Advisory (RA) is subsequently triggered.
- **If the TCAS considers the intruder to be a real collision threat:**
  - It generates a visual and aural Resolution Advisory (RA).
  - The AP/FD TCAS mode automatically engages: TCAS appears on the FMA. The flight crew has vertical guidance to fly the RA orders, automatically with the AP/FD, or manually with the FDs only (if AP was not engaged).
  - If the A/THR is disconnected, it automatically becomes armed or active, depending on the thrust lever position. When active, the speed/Mach mode engages, and the speed/Mach control becomes selected. For more information, *Refer to DSC-22_30-40-100 Normal Operations - When a RA is triggered - Consequence on A/THR and Speed/Mach Control*.
  - The vertical speed scale on the PFD indicates the vertical speed range within which the aircraft should fly.
- **When the TCAS considers that there is no more collision threat:**
  - It triggers the "CLEAR OF CONFLICT" aural alert.
  - In most of the cases, the AP/FD TCAS mode automatically reverts to V/S mode: The vertical speed target leads the aircraft toward the FCU selected altitude.
    If the altitude capture conditions are met at the clear of conflict, the AP/FD TCAS mode can revert to an altitude acquire, or an altitude hold mode. *Refer to DSC-22_30-40-100 Normal Operations - When a RA is triggered - Consequence on AP/FD Vertical Mode*.

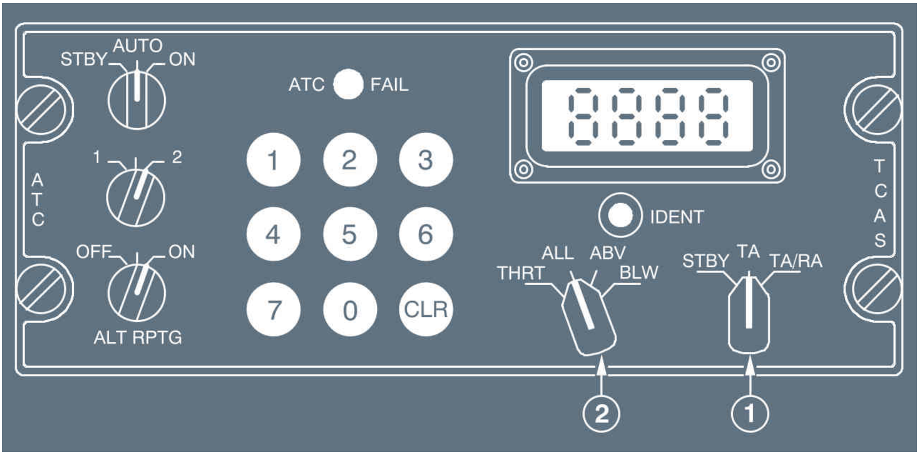
ATC/TCAS PANEL

Ident.: DSC-34-SURV-60-20-00001429.0004001 / 01 OCT 12

1 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**



(1) Mode sel

TA/RA	:	Normal position. The RAs, TAs and proximate intruders are displayed if the ALT RPTG switch is ON and the transponder is not on STBY.
TA	:	The TCAS does not generate any vertical orders. This mode should be used, in case of degraded aircraft performance (engine failure, landing gear extended, or approach on parallel runways). All RAs are converted into TAs. TAs, proximate and intruders are displayed if the ALT RPTG switch is ON and the transponder is not on STBY The "TA ONLY" white memo is displayed on the NDs.
STBY	:	The TCAS is on standby.

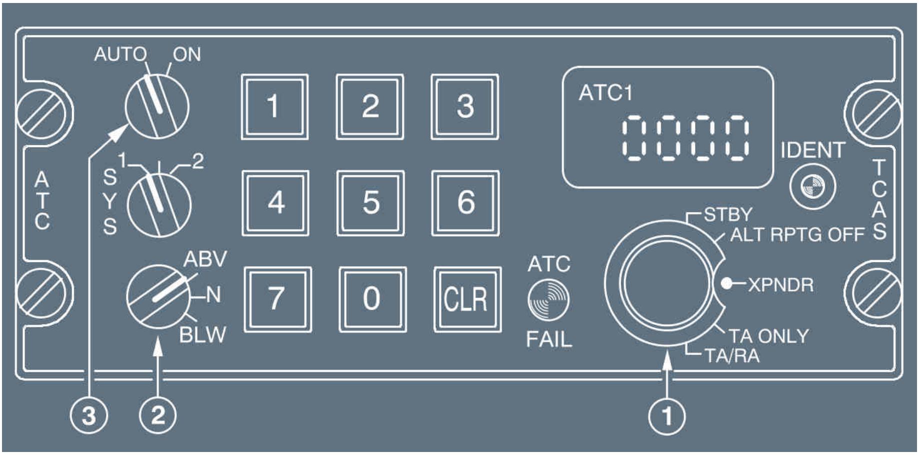
(2) TRAFFIC sel

THRT	:	Proximate and other intruders are displayed only if a TA or RA is present, and they are within 2 700 ft above and 2 700 ft below the aircraft.
ALL	:	Proximate and other intruders are displayed even if no TA or RA is present (full time function). The altitude range is –2700 ft to +2 700 ft.
ABV	:	The same as ALL, except that the other intruders are displayed if within 9 900 ft above the aircraft and 2 700 ft below.

BLW : The same as ALL, except that the other intruders are displayed if within 9 900 ft below the aircraft and 2 700 ft above.

ATC/TCAS PANEL

Ident.: DSC-34-SURV-60-20-00001429.0064001 / 01 OCT 12
Applicable to: MSN 01459



(1) Mode selector

TA/RA : Normal position.
TAs, RAs, proximate and other intruders are displayed.

TA ONLY : This mode should be used, in case of degraded aircraft performance (engine failure, landing gear extended, or approach on parallel runways).
All RAs are converted into TAs. TAs, proximate and other intruders are displayed.

STBY : The TCAS and ATC are on standby.

XPNDR :
- The TCAS is on standby
- On ground : The selected ATC Transponder only operates in the selective aircraft interrogation mode of Mode S
- In flight : The selected ATC Transponder operates.

(2) TRAFFIC selector

ABV : The altitude range is set to +7 000 ft above the aircraft, and -2 700 ft below the aircraft.

N : The altitude range is set to -2 700 ft below the aircraft, and +2 700 ft above the aircraft.

BLW : The altitude range is set to -7 000 ft below the aircraft, and +2 700 ft above the aircraft.

(3) AUTO/ON selector or THRT/ALL selector

ON (or ALL) : All intruders are displayed.

AUTO (or THRT) : Proximate and other intruders are only displayed, if a TA or RA is already presented.

Note: *Some TCAS control panels are equipped with a THRT/ALL selector, instead of the AUTO/ON selector. The associated functions remain unchanged.*

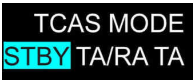
ATC PAGE ACCESS KEY

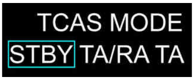
Displays the ATC Page (which controls the TCAS system) from the RMP (*Refer to DSC-23-45-10 RMP External Communication*).

TCAS MODE



The STBY (TA/RA, TA) TCAS mode is selected with the selected XPDR in AUTO mode.
The TA/RA or TA (STBY) mode are not selected. The flight crew can press the RMP R1 key to change the mode selection.
For more information upon TCAS mode, *Refer to DSC-34-SURV-60-10 TCAS Modes*.

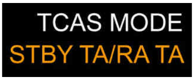
Note: *The flight crew can select the STBY mode on the ATC page whatever the A/C condition (in flight or on ground).*



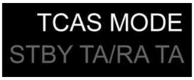
The STBY (TA/RA, TA) TCAS mode is selected with one of the following conditions :
- The selected XPDR is in STBY mode, or
- The altitude data transmission (ALT RPTG) is not activated.

The TA/RA or TA (STBY) mode are not selected. The flight crew can press the RMP R1 key to change the mode selection.
For more information upon TCAS mode, *Refer to DSC-34-SURV-60-10 TCAS Modes*.

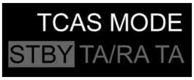
Note: *The flight crew can select the STBY mode on the ATC page whatever the A/C condition (in flight or on ground).*



The selected XPDR is failed. The flight crew cannot modify the TCAS mode.

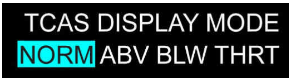


The link between RMP1 and AMU is failed. The flight crew cannot change the TCAS Mode.
If the flight crew switches off the RMP1, then RMP2 and RMP3 display the ATC page with the last valid data know before the failure.



An internal failure has occurred.

TCAS DISPLAY MODE



TCAS DISPLAY MODE
NORM ABV BLW THRT

The NORM (ABV, BLW, THRT) TCAS display mode is selected with all the following conditions:
- The selected XPDR is in AUTO mode, and
- The TCAS is in TA/RA or TA mode.

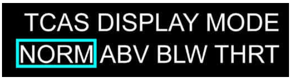
The ABV, BLW or THRT (NORM) TCAS display modes are not selected. The flight crew can press the RMP R2 key to change the mode selection.

NORM : Proximate and other intruders are displayed even if no TA or RA is present (full time function). The altitude range is within 2 700 ft above and 2 700 ft below the aircraft.

ABV : same behavior as NORM TCAS display mode, except that the other intruders are displayed if within 9 900 ft above and 2 700 ft below the aircraft.

BLW : same behavior as NORM TCAS display mode, except that the other intruders are displayed if within 2 700 ft above and 9 900 ft below the aircraft.

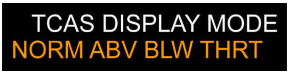
THRT : Proximate and other intruders are displayed only if a TA or RA is present, and they are within 2 700 ft above and 2 700 ft below the aircraft.



TCAS DISPLAY MODE
NORM ABV BLW THRT

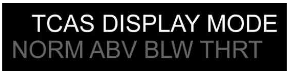
The NORM (ABV, BLW, THRT) TCAS display mode is selected with one of the following conditions:
- The selected XPDR is in STBY mode, and
- The TCAS is in STBY mode.
- The altitude data transmission (ALT RPTG) is not activated.

The ABV, BLW or THRT (NORM) TCAS display modes are not selected. The flight crew can press the RMP R2 key to change the mode selection.



TCAS DISPLAY MODE
NORM ABV BLW THRT

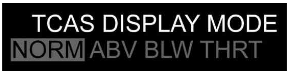
The selected XPDR is failed. The flight crew cannot modify the TCAS display mode.



TCAS DISPLAY MODE
NORM ABV BLW THRT

The link between RMP1 and AMU is failed. The flight crew cannot change the TCAS display Mode.

If the flight crew switches off the RMP1, then RMP2 and RMP3 display the ATC page with the last valid data know before the failure.



TCAS DISPLAY MODE
NORM ABV BLW THRT

An internal failure has occurred.

COMMON AREA

Refer to DSC-23-45-10 RMP External Communication.

ND INDICATIONS

Ident.: DSC-34-SURV-60-20-00020418.0002001 / 05 JUN 18
Applicable to: ALL

The traffic is displayed in all ROSE modes and ARC mode when 10, 20 or 40 NM range is selected. Only the 8 most threatening intruders are displayed.

No Bearing

(1) Proximate intruder
Indicated by a white filled diamond.

(2) TA intruder
Indicated by an amber circle.
Associated with the TRAFFIC-TRAFFIC aural message.

(3) RA intruder
Indicated by a red square.
Associated with vertical orders displayed on the PFD and aural messages.

(4) Other intruders ◁
Indicated by a white empty diamond.

Note: *If the range of an intruder is not available, the intruder is not displayed. An intruder may be partially displayed when its range is out of scale.*

(5) Relative altitude
Indicated in hundred of feet above or below the symbol depending on the intruder position.

(6) Vertical speed arrow
Displayed only if the intruder V/S > 500 ft/min.
The relative altitude and vertical speed arrow are displayed in the same color as the associated intruder symbol.
When an intruder does not report its altitude, the relative altitude and the vertical movement are not displayed.

(7) No bearing intruder

If the bearing of TA or RA intruder is not available the following data is presented in digital form at the bottom of the ND:
- range
- relative altitude and vertical speed arrow if available.

Displayed amber or red according to threat level.

(8) Range ring
A 2.5 NM white range ring is displayed when a 10 NM or 20 NM range is selected.

(1) Mode and range messages

Following messages can be displayed to draw pilot’s attention:

TCAS : REDUCE RANGE	:	Displayed when a TA or RA is detected and ND range above 40 NM.
TCAS : CHANGE MODE	:	Displayed when a TA or RA is detected and ND mode is PLAN.

Displayed amber or red depending on the advisory level (TA or RA).

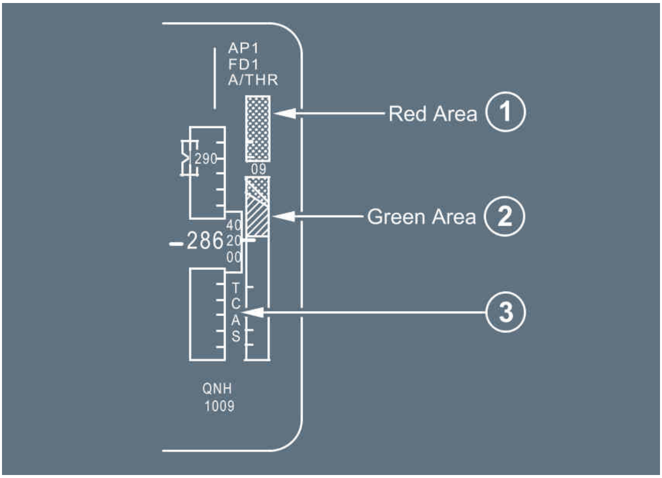
(2) TCAS operation messages

TCAS	:	Displayed in case of TCAS internal failure.
TA ONLY	:	Displayed white when the TA mode is selected automatically, or manually by the flight crew.

PFD INDICATIONS

Ident.: DSC-34-SURV-60-20-00020420.0003001 / 17 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

In case of RA detection, the PFD presents vertical orders on the vertical speed scale. The vertical speed scale background is normally grey, but may be partially replaced by green and/or red areas.



(1) Red area
Indicates the vertical speed range, when there is a high risk of conflict.

(2) Green area
Indicates the recommended vertical speed range. It is wider than the red area.

Note:
- *The aircraft can also fly in the grey vertical speed range, without the risk of conflict (preventive RA).*
- *The color of the digits corresponds to the appropriate area.*
- *In case of RA detection, the vertical speed needle that is normally green, becomes white.*

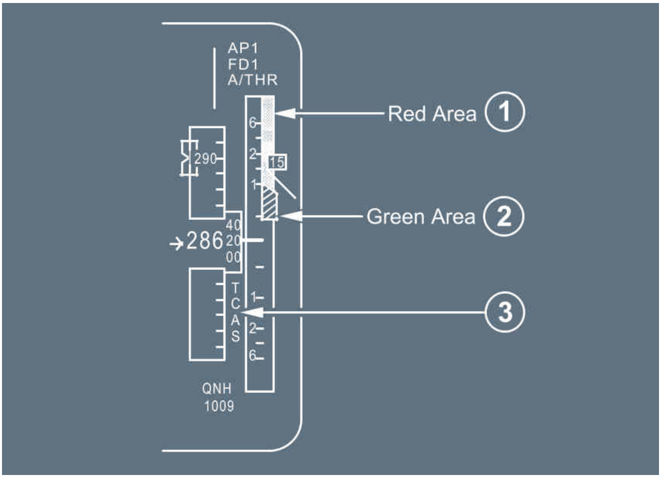
(3) TCAS message
It is displayed when the TCAS cannot deliver RA data, or in case of an internal TCAS failure, provided that the TCAS is not in standby.

PFD INDICATIONS

Ident.: DSC-34-SURV-60-20-00020420.0005001 / 17 MAR 17

3 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

In case of RA detection, the vertical speed scale becomes rectangular and the PFD presents vertical orders on the vertical speed scale. The vertical speed scale background is normally grey, but may be partially replaced by green and/or red areas.



(1) Red area
Indicates the vertical speed range, when there is a high risk of conflict.

(2) Green area
Indicates the recommended vertical speed range. It is wider than the red area.

Note:
- *The aircraft can also fly in the grey vertical speed range, without the risk of conflict (preventive RA).*
- *The color of the digits corresponds to the appropriate area.*
- *In case of RA detection, the vertical speed needle that is normally green, becomes white.*

(3) TCAS message
Appears in amber provided that the TCAS is not in standby, when the TCAS cannot deliver RA data, or in case of an internal TCAS failure.

AURAL MESSAGES

Ident.: DSC-34-SURV-60-20-00001433.0018001 / 08 FEB 13

4 **Applicable to: MSN 01158-01246, 01376, 01518, 01593-01628, 01801, 01826, 01837-01855, 02321, 02734, 02896-02904, 03002-03047, 03111, 03391, 04441, 04827-04860, 05184-05987, 06097, 06121, 06139-09324, 10949-11597**

TA/RA detection is associated with the following messages:

"TRAFFIC TRAFFIC" : Only in case of TA detection.
"CLIMB CLIMB" : Climb at the vertical speed indicated by the green area on the PFD.

"CLIMB, CROSSING CLIMB" (twice) : Same as above. Indicates that you will cross through the intruder altitude.
"INCREASE CLIMB" (twice) : Triggered after the CLIMB message, if vertical speed is insufficient to achieve safe vertical separation.
"DESCEND DESCEND" : Descend at the vertical speed indicated by the green area on the PFD.
"DESCEND, CROSSING DESCEND" (twice) : Same as above. Indicates that you will cross through the intruder altitude.
"INCREASE DESCEND" (twice) : Triggered after the DESCEND message, if the vertical speed is insufficient to achieve safe vertical separation.
"LEVEL OFF, LEVEL OFF" : Set the Vertical Speed to 0.
"CLIMB CLIMB NOW" (twice) : Triggered after the DESCEND message, if the intruder trajectory has changed.
"DESCEND DESCEND NOW" (twice) : Triggered after the CLIMB message, if the intruder trajectory has changed.
"MONITOR VERTICAL SPEED" : Ensure that the vertical speed remains outside the red area.
Triggered only once, in case of preventive RA.
"MAINTAIN VERTICAL SPEED, MAINTAIN" : Maintain the vertical speed indicated on the green area of the PFD.
"MAINTAIN VERTICAL SPEED, CROSSING MAINTAIN" : Maintain the vertical speed indicated on the green area of the PFD.
Indicates that you will cross through the intruder altitude.
"CLEAR OF CONFLICT" : The range increases and separation is adequate. Return to assigned clearance.

AURAL MESSAGES

Ident.: DSC-34-SURV-60-20-00001433.0002001 / 15 FEB 11
Applicable to: MSN 01143, 01251, 01459, 01825, 01832, 02014, 02887, 02924, 03058, 03180-03313, 03565-03710, 03733-04389, 04446-04773, 04953-05107

TA/RA detection is associated with the following messages:

"TRAFFIC TRAFFIC" : Only in case of TA detection.
"CLIMB CLIMB" : Climb at the vertical speed indicated by the green area on the PFD.
"CLIMB, CROSSING CLIMB" (twice) : Same as above. Indicates that you will cross through the intruder altitude.
"INCREASE CLIMB" (twice) : Triggered after the CLIMB message, if vertical speed is insufficient to achieve safe vertical separation.

"DESCEND DESCEND"	Descend at the vertical speed indicated by the green area on the PFD.
"DESCEND, CROSSING DESCEND" (twice)	Same as above. Indicates that you will cross through the intruder altitude.
"INCREASE DESCEND" (twice)	Triggered after the DESCEND message, if the vertical speed is insufficient to achieve safe vertical separation.
"ADJUST VERTICAL SPEED, ADJUST"	Adjust the vertical speed to that indicated on the green area of the PFD, reducing climb vertical speed or descent vertical speed, as appropriate.
"CLIMB CLIMB NOW" (twice)	Triggered after the DESCEND message, if the intruder trajectory has changed.
"DESCEND DESCEND NOW" (twice)	Triggered after the CLIMB message, if the intruder trajectory has changed.
"MONITOR VERTICAL SPEED"	Ensure that the vertical speed remains outside the red area. Triggered only once, in case of preventive RA.
"MAINTAIN VERTICAL SPEED, MAINTAIN"	Maintain the vertical speed indicated on the green area of the PFD.
"MAINTAIN VERTICAL SPEED, CROSSING MAINTAIN"	Maintain the vertical speed indicated on the green area of the PFD. Indicates that you will cross through the intruder altitude.
"CLEAR OF CONFLICT"	The range increases and separation is adequate. Return to assigned clearance.

MEMO DISPLAY

Applicable to: MSN 01251

TCAS STBY : This memo appears in green when:

- ATC STBY or TCAS STBY is selected by the crew, or
- ALT RPTG sw is OFF, or
- both ATCs or both RAs are failed.

Intentionally left blank

UNDUE NAV TCAS FAULT

Ident.: DSC-34-SURV-60-30-00024314.0003001 / 10 MAY 21
Applicable to: MSN 02014, 06561

DESCRIPTION

On ground, an undue NAV TCAS FAULT alert is triggered when:
- The ADIRUs are off, or
- IR1 is not yet aligned.

The alert automatically disappears when the ADIRUs are powered and IR1 is aligned.

OPERATIONAL RECOMMENDATIONS

On ground, if the NAV TCAS FAULT alert is triggered in the above configurations, the flight crew can disregard it.

Intentionally left blank

DESCRIPTION

Ident.: DSC-35-10-00001448.0001001 / 20 DEC 10
Applicable to: ALL

The oxygen system consists of:

- A cockpit-fixed oxygen system, which supplies adequate breathing oxygen to the cockpit occupants in case of depressurization, or emission of smoke and noxious gases.
- A cabin-fixed oxygen system, which supplies oxygen for cabin occupants (passengers and cabin crew) in case of depressurization.
- A portable oxygen system, which is provided in both the cockpit and cabin and is to be used:
  - As PROTECTION for the crew during on board emergencies.
  - For FIRST AID purposes.

Intentionally left blank

GENERAL

Ident.: DSC-35-20-10-00017801.0002001 / 21 MAR 16
1 **Applicable to: MSN 08495-09324, 10949-11597**

The cockpit's fixed oxygen system is separated into two sub-systems:
- One sub-system supplies oxygen to the Captain and the 3rd Occupant,
- One sub-system supplies oxygen to the First Officer and the 4th Occupant ◁ .

The cockpit's fixed oxygen system consists of:
- Two high-pressure cylinders.
- Two pressure regulators, connected directly to the cylinders that deliver oxygen, at a pressure suitable for users.
- Four overpressure safety systems to vent oxygen overboard, through an overboard discharge indicator, if the pressure becomes too high.
- Two supply solenoid valves that allow the crew to shut off the distribution system.
- Three (or four ◁) full-face quick-donning masks, stowed in readily-accessible boxes adjacent to the crewmembers' seats (one at each seat).

GENERAL

Ident.: DSC-35-20-10-00017801.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

The cockpit's fixed oxygen system consists of :
- A high-pressure cylinder, located in the left-hand lower fuselage.
- A pressure regulator, connected directly to the cylinder that delivers oxygen, at a pressure suitable for users.
- Two overpressure safety systems to vent oxygen overboard, through a safety port, if the pressure becomes too high.
- A supply solenoid valve that allows the crew to shut off the distribution system.
- Three (or four ◁) full-face quick-donning masks, stowed in readily-accessible boxes adjacent to the crewmembers' seats (one at each seat).

OPERATION

Ident.: DSC-35-20-10-00001450.0001001 / 21 MAR 16
Applicable to: ALL

The crewmember squeezes the red grips to pull the mask out of its box, and this action causes the mask harness to inflate.
A mask-mounted regulator supplies a mixture of air and oxygen or pure oxygen, or performs emergency pressure control. With the regulator set to NORMAL, the user breathes a mixture of cabin

air and oxygen up to the cabin altitude at which the regulator supplies 100 % oxygen. The user can select 100 %, in which case the regulator supplies pure oxygen at all cabin altitudes.
If the situation calls for it, the user can use the emergency overpressure rotating knob and receive pure oxygen at positive pressure.
The storage box contains a microphone lead, with a quick-disconnect, for connection to the appropriate mask microphone cable.

Note: *Each mask may have a removable film that protects the visor against scratches. This strip is optional and may be removed from the mask at any time.*

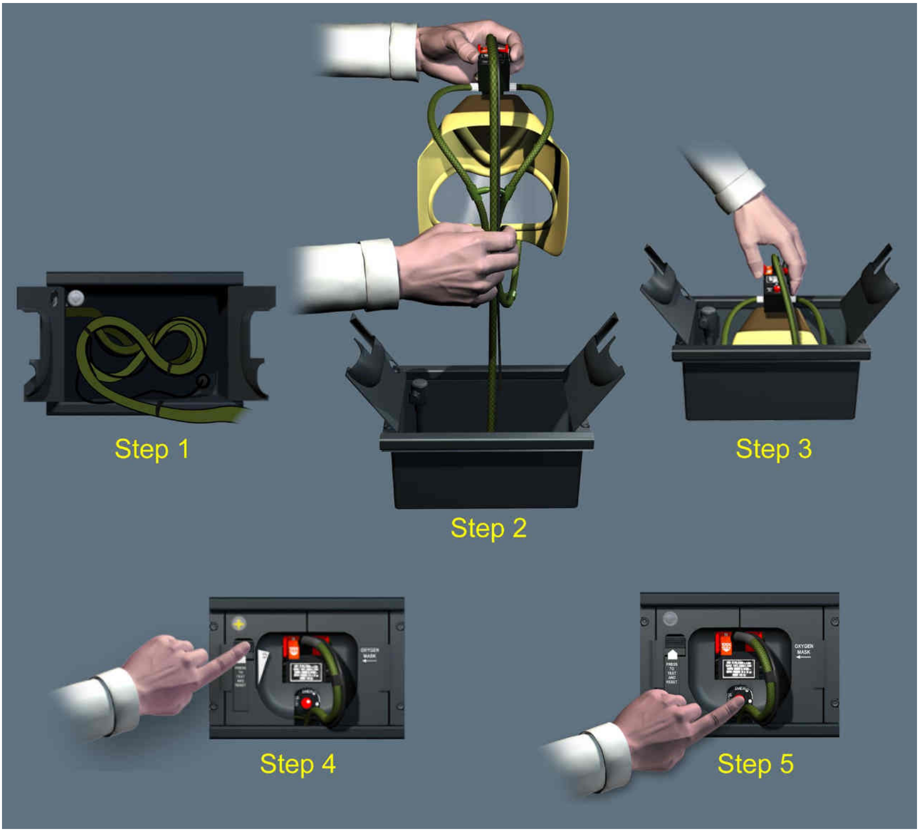
MASK STOWAGE

Ident.: DSC-35-20-10-00001453.0001001 / 03 NOV 22
Applicable to: ALL



STEP 1

Coil the supply hose that is connected to the crew oxygen mask in an "eight (8)" symbol and place it in the bottom of the stowage box.

STEP 2

Position the remaining hose in the middle of the mask.
Fold the two harness portions together.

STEP 3

Put the mask in the stowage box.
Make sure that the mask touches the bottom of the stowage box.

STEP 4

Close the doors of the mask stowage box.
Firmly press the PRESS TO TEST AND RESET pb.
When released, check that the OXY ON flag disappears.

STEP 5

Press the EMERGENCY selector, and check that the blinker remains black.
Return the N/100% selector to the 100% position.

CAUTION	Maintaining the EMERGENCY selector in the EMERGENCY position can deplete the crew oxygen cylinder.

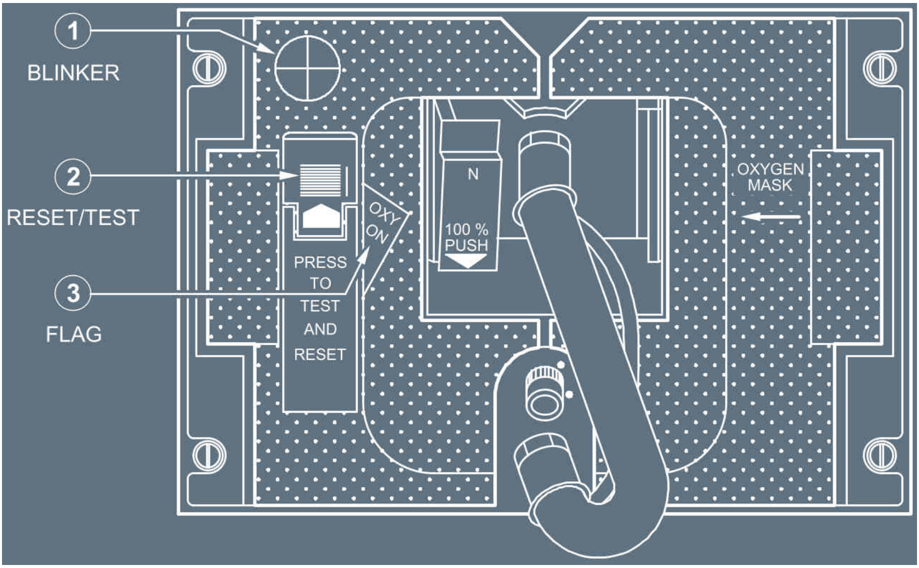
(1) CREW SUPPLY pb
This pushbutton controls the solenoid valve.

On : The valve is open, and supplies low pressure oxygen to the masks (normal position in flight).

OFF: The valve is closed, and the white light comes on.

STOWAGE BOX

Ident.: DSC-35-20-20-00001455.0001001 / 22 MAY 12
Applicable to: ALL



(1) Blinker flowmeter (yellow)
This indicator flashes when oxygen is flowing.

(2) RESET/TEST control slide
The crewmember presses the slide, and pushes it in the direction of the arrow to test: the operation of the blinker; the regulator supply; system sealing downstream of the valve; and the regulator sealing and system operation. Pressing the RESET control slide, after the oxygen mask has been used, cuts off the oxygen, and the mask microphone.

(3) OXY ON flag
As soon as the left flap door opens, the mask is supplied with oxygen and, once it closes (mask still supplied with oxygen), the “OXY ON” flag appears.

(1) Red grips
Squeezing the right-hand side grip unlocks the two-flap door, and permits the harness to inflate.

(2) EMERGENCY pressure selector

Use of this selector creates on overpressure which eliminates condensation or fogging of the mask, and prevents smoke, smell or ashes from entering the mask.

- Pressing this knob generates an overpressure for a few seconds.
- Turning the knob, in the direction of the arrow, generates a permanent overpressure.

Note: *1. Overpressure supply is automatically started, when cabin altitude exceeds 30 000 ft.*
2. Overpressure supply is available only when the N/100% selector is set on the on the 100 % position.

(3) N/100 % selector

This two-position button is locked down (100% position) when the crewmember pulls the mask out of the stowage.Pushing the button up from underneath releases it, and it pops up to the N (normal) position. Pressing it again returns it to 100 %.

100 %	:	The mask delivers 100 % oxygen.
N	:	The mask provides the flight crew with a mixture of air and oxygen. This mixture changes with cabin altitude. The higher the cabin altitude, the more oxygen the mask provides, until the mask supplies 100 % oxygen.

GENERAL

Ident.: DSC-35-30-10-00017804.0001001 / 13 MAY 16
Applicable to: ALL

In the case of depressurization, the fixed oxygen system in the cabin supplies oxygen to the cabin occupants.
Chemical generators produce the oxygen. Each generator feeds a group of 2, 3, or 4 masks.
Oxygen masks are located in containers above the passenger seats, in the lavatories, in each galley ◁ , and at each cabin crew station.

Note: Gaseous generators ◁ replace chemical generators in the lavatories.

OPERATION

Ident.: DSC-35-30-10-00016920.0001001 / 21 MAR 16
Applicable to: ALL

Each container has an electrical latching mechanism that opens automatically to allow the masks to drop, if the cabin pressure altitude exceeds 14 000 ft (+250, -750 ft), or 16 000 ft (+250, -750 ft) for the operation on high altitude airfields ◁ .
Members of the flight crew can override the automatic control.
When the masks are released, the passenger address system automatically broadcasts prerecorded instructions ◁ .
The generation of oxygen begins when the passenger pulls the mask towards the passenger seat.
The chemical reaction used for oxygen generation creates heat. Therefore, the smell of burning, smokes and cabin temperature increase may be associated with the normal operation of the oxygen generators. The mask receives pure oxygen under positive pressure for about 13 min ◁ , 15 min ◁ , or up to 22 min ◁ , until the generator is exhausted.
A reset is available for the rearming of the system after the masks are restowed. A manual release tool allows crew members to open the doors manually in case of electrical failure.

The OXY PAX ON memo displays as soon as cabin oxygen masks fall down in the cabin, either automatically, or manually.

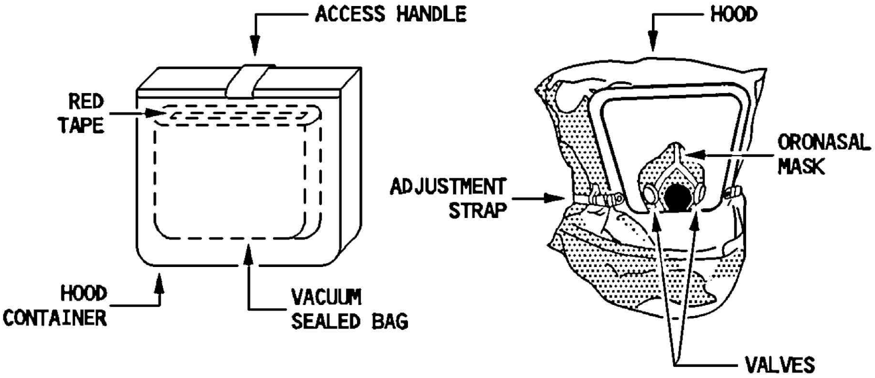
OXY PAX ON : This memo appears in green when both CPC detect excessive cabin altitude.

OXY PAX ON : This memo appears in amber when one CPC or both CPC do not detect excessive cabin altitude.

FLIGHT CREWS PORTABLE OXYGEN SYSTEM

Ident.: DSC-35-40-10-00001465.0003001 / 17 MAR 11
Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02734, 02896-03710, 03733-04544

The flight crew smoke hood located on the right back side of the cockpit, ensures the eyes and respiratory system protection of one flight crew member when fighting a fire and in case of smoke or noxious gas emissions or cabin depressurization.
The smoke hood is based on a chemical air regeneration system, located at the back of the hood. An oronasal mask allows the inhalation of regenerated air via the inhalation valves and returns the exhaled breath to the regenerator system.



The effective time of use is between 15 and 30 min, depending on the workrate.

FLIGHT CREWS PORTABLE OXYGEN SYSTEM

Ident.: DSC-35-40-10-00001465.0005001 / 20 DEC 16
Applicable to: MSN 01459, 02014-02321, 02887, 04563, 05005, 05097

There is one Portable Breathing Equipment (PBE) in the cockpit. The PBE is a hood, located in a container. The PBE is stored on the right aft side of the cockpit. It ensures the eyes and respiratory system protection of one flight crew member when fighting a fire and in case of smoke or noxious gas emissions or cabin depressurization.
The PBE uses a chemical air regeneration system, which is in the breathing key. An oronasal mask allows the user to inhale regenerated air, and it returns the exhaled breath to the regeneration system.

If the container is equipped with a yellow serviceability indicator:
- When the indicator is cracked, the breathing protection can be insufficient and therefore the PBE cannot be used.

If the container is equipped with a red/green serviceability indicator:
- When the indicator is green, the hood can be used.
- When the indicator is red, the breathing protection can be insufficient and therefore the PBE cannot be used.

The hood operates for at least 15 min.

Intentionally left blank

GENERAL

Ident.: DSC-36-10-10-00020804.0001001 / 17 MAR 17
Applicable to: ALL

The pneumatic system supplies high-pressure air for :
- Air conditioning
- Engine starting
- Wing anti-icing
- Water pressurization
- Hydraulic reservoir pressurization
- FWD cargo heating ◁
- AFT cargo heating ◁
- Fuel Tank Inerting System (FTIS) ◁ .

High-pressure air has three sources :
- Engine bleed systems
- APU load compressor
- HP ground connection

Note: *An external HP source may be used for air conditioning.*

A crossbleed duct interconnects the engine bleed systems and receives air from the APU and ground sources when appropriate.
A valve mounted on the crossbleed duct allows the left side (engine 1) and right side (engine 2) to be interconnected.
Two Bleed Monitoring Computers (BMC1 and BMC2), the overhead control panel, and the ECAM control and monitor the operation of the pneumatic system.
A leak detection system detects any overheating in the vicinity of hot air ducts.

Intentionally left blank

GENERAL

Ident.: DSC-36-10-20-00001469.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft has two similar engine bleed air systems.

Each system is designed to :
- select the compressor stage to use as a source of air
- regulate the bleed air temperature
- regulate the bleed air pressure.

A Bleed Monitoring Computer (BMC) controls and monitors each system.
Each BMC receives information about bleed pressure and temperature and valve position.

Each is connected with :
- other systems using air or information from the bleed system
- the other BMC.

Each supplies indications and warnings to the ECAM and CFDS.
If one BMC fails, the other one takes over most of the monitoring functions.
Each bleed valve is pneumatically operated and controlled electrically by its associated BMC.

AIR BLEED SELECTION

Ident.: DSC-36-10-20-00001471.0003001 / 05 MAR 19

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 04441-04544, 04827-04974, 05066, 05101-05342, 05591-05883, 06139, 06173-07098

Air is normally bled from the intermediate pressure stage (IP) of engine's high-pressure (HP) compressor to minimize fuel penalty.
At low engine speed, when the pressure and temperature of the IP air are too low, the system bleeds air from the HP stage and maintains it at 36 ± 4 PSI.
An intermediate pressure check valve downstream of the IP port closes to prevent air from the HP stage from being circulated to the IP stage.

L3 The HP valve closes automatically:
- Pneumatically:
  - In case of low upstream pressure
  - In case of excessive upstream pressure
- Electrically when the bleed valve is closed electrically.

PRESSURE REGULATION AND LIMITATION

Ident.: DSC-36-10-20-00001472.0001001 / 09 NOV 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02887-02896, 03032-03180

The bleed valve, which is downstream of the junction of HP and IP ducting, acts as a shut-off and pressure regulating valve.
It maintains delivery pressure at 45 ± 5 PSI.

Note: *Bleed pressure may fluctuate between 38 and 56 PSI (with a maximum peak to peak pressure of 16 PSI) particularly at high engine power (takeoff or climb) up to FL 100.*

The bleed valve is fully closed:

- Pneumatically:
  - If upstream pressure goes below 8 PSI
  - If there is return flow
- Electrically by means of:
  - The BLEED pushbutton switch (switched OFF)
  - The ENG FIRE pushbutton (pushed)
  - The Bleed air Monitoring Computer (BMC) in the following cases:
    - Overtemperature
    - Overpressure
    - Leak
    - Open starter valve
    - APU bleed being ON.

If pressure regulation fails, the overpressure valve closes when the pressure goes over 75 PSI.

Note: *If APU Bleed is ON and the crossbleed valve is SHUT, the Engine bleed valve 2, remains open.*

The bleed valve, which is downstream of the junction of HP and IP ducting, acts as a shut-off and pressure regulating valve.
It maintains delivery pressure at 45 ± 5 PSI.

Note: *Bleed pressure may fluctuate between 38 and 56 PSI (with a maximum peak to peak pressure of 16 PSI) particularly at high engine power (takeoff or climb) up to FL 100.*

The bleed valve is fully closed:
- Pneumatically:
  - If upstream pressure goes below 8 PSI
  - If there is return flow.
- Electrically by means of:
  - The ENG 1(2) BLEED pb-sw if switched OFF
  - The ENG 1(2) FIRE pb if pushed
  - The BMC in the following cases:
    - Overtemperature
    - Overpressure
    - Leak
    - Open starter valve
    - Engine shutdown
    - APU bleed being ON
    - Bleed temperature lost.

If pressure regulation fails, the overpressure valve closes when the pressure goes over 75 PSI.

Note: *If APU Bleed is ON and the crossbleed valve is SHUT, the Engine bleed valve 2 remains open.*

PRESSURE REGULATION AND LIMITATION

Ident.: DSC-36-10-20-00001472.0003001 / 10 MAY 21

5 **Applicable to: MSN 08495-09324, 10949-11597**

The bleed valve, which is downstream of the junction of HP and IP ducting, acts as a shut-off and pressure regulating valve.
It maintains delivery pressure at 42 ± 3 PSI in dual bleed configuration and at 50 ± 3 PSI in single bleed configuration.

Note: *Bleed pressure may fluctuate between ± 8 PSI when bleeding from IP port at high engine power, or when bleeding from HP port in holding or approach phases.*

The bleed valve is fully closed:

- Pneumatically:
  - If upstream pressure goes below 15 PSI
  - If there is return flow.
- Electrically by means of:
  - The ENG 1(2) BLEED pb-sw if switched OFF
  - The ENG 1(2) FIRE pb if pushed
  - The BMC in the following cases:
    - Overtemperature
    - Overpressure
    - Leak
    - Open starter valve
    - Engine shutdown
    - APU bleed being ON
    - No bleed consumers
    - HPV failed open
    - Bleed temperature lost.

If pressure regulation fails, the overpressure valve closes when the pressure goes over 75 PSI.

Note: *If APU Bleed is ON and the crossbleed valve is SHUT, the Engine bleed valve 2 remains open.*

TEMPERATURE REGULATION AND LIMITATION

Ident.: DSC-36-10-20-00001473.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

A precooler downstream of the bleed valve regulates the temperature of the bleed air.
The precooler is an air-to-air heat exchanger that uses cooling air bleed from the engine fan to regulate the temperature to approximately 200 °C.
The fan air valve controls fan air flow.
A spring keeps the fan air valve closed in the absence of pressure.

TEMPERATURE REGULATION AND LIMITATION

Ident.: DSC-36-10-20-00001473.0002001 / 28 NOV 17
6 **Applicable to: MSN 08495-09324, 10949-11597**

A precooler downstream of the bleed valve regulates the temperature of the bleed air.

The precooler is an air-to-air heat exchanger that uses cooling air bleed from the engine fan to regulate the temperature to approximately 200 °C (or 160 °C during climb or hold with the two engine bleeds but without the wing anti-ice).
The fan air valve controls fan air flow.
A spring keeps the fan air valve closed in the absence of pressure.

Intentionally left blank

GENERAL

Ident.: DSC-36-10-30-00001474.0001001 / 09 NOV 17
Applicable to: ALL

Air from the APU load compressor is available on ground and in flight.
The APU bleed valve operates as a shut-off valve to control APU bleed air.
The APU BLEED pb-sw, on the AIR COND panel, controls the APU bleed valve. When the flight crew selects ON with the pushbutton, APU bleed air supplies the pneumatic system, if the APU speed is above 95 %. This opens the crossbleed valve and closes the engine bleed automatically.
If the APU bleed valve is opened, it automatically closes in the case of APU leak, left wing leak, or pylon 1 leak (except during engine start). *Refer to DSC-36-10-50 Leak Detection*.
A check valve near the crossbleed duct protects the APU, when bleed air comes from another source.

Intentionally left blank

GENERAL

Ident.: DSC-36-10-40-00001476.0001001 / 21 MAR 16
Applicable to: ALL

A crossbleed valve on the crossbleed duct allows the air supply systems of the two engines to be isolated or interconnected.
On the AIR COND panel, a rotary selector controls the crossbleed valve electrically.
Two electric motors, one for automatic mode and one for manual mode, control the valve.
In automatic mode, the crossbleed valve opens when the system uses APU bleed air. It closes, if the system detects an air leak (except during engine start).

LEAK DETECTION

Ident.: DSC-36-10-50-00001479.0001001 / 15 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

Leak detection loops detect any overheating near the hot air ducts in the fuselage, pylons, and wings.
For the pylon and APU, the sensing elements are tied to form a single loop and for the wing, a double loop.
When the two wing loops detect a leak, or when one loop detects the leak and the other one is inoperative, they activate a wing leak signal.
BMC1 and BMC2 each contain identical control logic for the system.

- A wing leak signal causes :
  - the bleed valve on the related side to close automatically
  - the associated FAULT light on the AIR COND panel to come on
  - the x-bleed valve to close automatically (except during an engine start)
  - the APU bleed valve to close automatically if the APU bleed valve is open and if the leak concerns the left wing (except during engine start).
- A pylon leak signal causes :
  - the bleed valve on the related side to close automatically
  - the FAULT light for the related engine on the AIR COND panel to come on
  - the x-bleed valve to close automatically (except during an engine start).
  - the APU bleed valve to close automatically if the APU bleed valve is open and if the leak concerns the pylon 1 (except during engine start).
- An APU leak signal causes :
  - the APU bleed valve to close automatically (except during engine start).
  - the FAULT light the APU BLEED pushbutton switch on the AIR COND panel to come on
  - the x-bleed valve to close automatically (except during an engine start).

(1) ENG 1 and ENG 2 BLEED pb sw

On	:	Bleed valve opens if : - Upstream pressure is above 8 PSI. - APU BLEED pushbutton switch is off or APU bleed valve is closed. - There is no onside wing or pylon leak, and no overpressure or overtemperature has been detected. - The ENG FIRE pushbutton has not been popped out. - The engine start valve is closed.
FAULT lt	:	This amber light comes on, and an ECAM caution appears, if : - There is an overpressure downstream of the bleed valve. - There is a bleed air overheat. - There is a wing or pylon leak on the related side. - The bleed valve is not closed during engine start. - The bleed valve is not closed with APU bleed ON. It goes out when the ENG BLEED pushbutton switch is OFF if the fault has disappeared.
OFF	:	The bleed valve and HP valve close. The white OFF light comes on.

(2) APU BLEED pb sw

ON	:	The APU valve opens if N > 95 % and there is no leak in the APU or in the left side bleed. (If there is a leak on the right side, the x-bleed valve closes.) The blue ON light comes on.
Off	:	The APU valve closes.
FAULT light	:	This amber light comes on, and an ECAM caution appears, when the system detects an APU leak.

(3) X-BLEED selector sw

AUTO	:	The crossbleed valve is open if the APU bleed valve is open. The crossbleed valve is closed if the APU bleed valve is closed or, in case of a wing, pylon, or APU leak (except during engine start).
OPEN	:	The crossbleed valve is open.
SHUT	:	The crossbleed valve is closed.

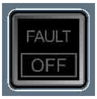
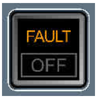
ENG 1(2) BLEED PB-SW

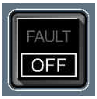


Bleed valve opens if:
- Upstream pressure is above 8 PSI
- APU BLEED pb-sw is off or APU bleed valve is closed
- There is no onside wing or pylon leak, and no overpressure or overtemperature has been detected
- The ENG FIRE pb has not been popped out
- The engine start valve is closed.



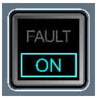
The FAULT light comes on, and an ECAM alert appears, if:
- There is an overpressure downstream of the bleed valve
- There is a bleed air overheat
- There is a wing or pylon leak on the related side
- The bleed valve is not closed during engine start
- The bleed valve is not closed with APU bleed ON
- Dual BTS failure.

The FAULT light goes off when the associated ENG 1(2) BLEED pb-sw is set to OFF, and the applicable failure disappears.

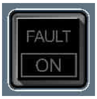


The bleed valve and HP valve close. The OFF light comes on.

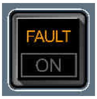
APU BLEED PB-SW



The APU valve opens if N is more than 95 % and there is no leak in the APU or in the left side bleed (if there is a leak on the right side, the x-bleed valve closes).
The ON light comes on.

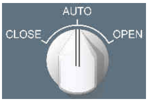


The APU valve closes.



The FAULT light comes on, and an ECAM alert appears, when the system detects an APU leak.

X-BLEED SELECTOR



The crossbleed valve is open if the APU bleed valve is open.
The crossbleed valve is closed if the APU bleed valve is closed or, in the case of a wing, pylon, or APU leak (except during engine start).

(1) ENG 1 and ENG 2 BLEED pb sw

On : Bleed valve opens if :
- Upstream pressure is above 15 PSI.
- APU BLEED pb-sw is off or APU bleed valve is closed.
- There is no onside wing or pylon leak, and no overpressure or overtemperature has been detected.
- The ENG FIRE pb has not been popped out.
- The engine start valve is closed.
- At least one bleed consumer (Pack or WAI) is ON on the same side or at least one bleed consumer is ON on the opposite side with the crossbleed valve is open.

FAULT lt : This amber light comes on, and an ECAM caution appears, if :

- There is an overpressure downstream of the bleed valve.
- There is a bleed air overheat.
- There is a wing or pylon leak on the related side.
- The bleed valve is not closed during engine start.
- The bleed valve is not closed with APU bleed ON.
- HP valve failed open on ground.
- Single BTS failure on ground or BTS disagree on ground.
- Dual BTS failure in flight or on ground.
- Fan Duct burst detected by the FADEC (LEAP-1A engines only).

It goes out when the ENG BLEED pb-sw is OFF if the fault has disappeared.

OFF : The bleed valve, fan air valve and HP valve close. The white OFF light comes on.

(2) APU BLEED pb sw

ON : The APU valve opens if N > 95 % and there is no leak in the APU or in the left side bleed. (If there is a leak on the right side, the x-bleed valve closes.)
The blue ON light comes on.

Off : The APU valve closes.

FAULT light : This amber light comes on, and an ECAM caution appears, when the system detects an APU leak.

(3) X-BLEED selector sw

AUTO : The crossbleed valve is open if the APU bleed valve is open.
The crossbleed valve is closed if the APU bleed valve is closed or, in case of a wing, pylon, or APU leak (except during engine start).

OPEN : The crossbleed valve is open.

SHUT : The crossbleed valve is closed.

HP VALVE INDICATIONS

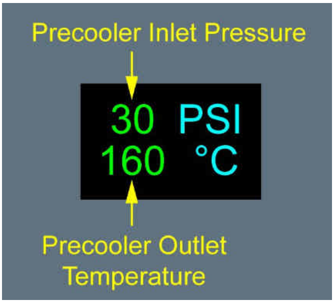
⦶	HP valve normally fully closed.
⊖	HP valve not fully closed.
⦶	HP valve not in commanded (closed) position.

ENGINE BLEED VALVE INDICATIONS

⦶	BLEED valve normally open.
⊖	BLEED valve normally fully closed.

⦶	BLEED valve not in commanded (open) position.
⊖	BLEED valve not in commanded (closed) position.

ENGINE BLEED INDICATIONS



Precooler inlet pressure

It is normally in green.
It becomes amber, if under 4 PSI, or if overpressure is detected by the BMC (threshold between 57 and 60 PSI).

Precooler outlet temperature

It is normally in green.
It becomes amber, if the BMC detects an overheat or low temperature.

Overheat: Temperature exceeds:
- 290 °C for more than 5 s, or
- 270 °C for more than 15 s, or
- 257 °C for more than 55 s.

Low temperature is detected (only in-flight), if the bleed temperature drops below 150 °C, the wing anti-ice is on, and the pressure regulating valve is in the open position. Low temperature may, however, only be due to low outside air temperature.

Note: *When the engines are at idle, and depending on the ambient temperature, the precooler outlet temperature may be below 150 °C (displayed amber).*

APU BLEED VALVE INDICATIONS

The APU valve is not fully open, and the APU master switch is ON.

The APU valve is fully open, and the APU master switch is ON.

The APU valve is fully closed, the APU master switch is ON, and the APU bleed switch is ON for more than 10 s.

CROSSBLEED VALVE INDICATIONS

The crossbleed valve is normally closed.

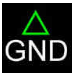
The crossbleed valve is normally open.

The crossbleed valve is not in the commanded (closed) position.

The crossbleed valve is not in the commanded (open) position.

The crossbleed valve is in transit.

GND HP GROUND CONNECTION INDICATION



Indicates that it is possible to connect the HP ground air supply.
It appears on ground only.

ANTI ICE INDICATION

ANTI ICE	When the WING pb on the ANTI-ICE panel is ON.

ARROW

◁

- It is normally not displayed, when the corresponding valve is closed.
- It is normally displayed in green, when the corresponding valve is open.
- It becomes amber, when the
  - Valve is open and air pressure is low or high, or
  - Valve is open on ground for more than 10 s.

ENGINE IDENTIFICATION (1-2)

1	The engine is running.
1	The engine N2 is below idle.

GENERAL

Ident.: DSC-38-10-00017274.0001001 / 21 MAR 16
Applicable to: ALL

The water and waste systems :
- Distribute potable water to the toilets and the galleys
- Dispose waste water
- Store toilet wastes.

The systems are insulated to prevent water leaks and ice build up.
Controls of the water and waste systems are located on the Forward Attendant Panel (FAP).

POTABLE WATER

Ident.: DSC-38-10-A-00017286.0001001 / 28 MAY 20
1 **Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03222-03229, 03294, 03588-03595, 03710, 03733-04389, 04563-04773, 05005, 05097, 05345-05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

Potable water is stored in a 200 l water tank (or 135 l water tank) located in the aft cargo compartment, in the wall on the left side.
On ground, the water system is pressurized by the air from the service panel pressure port (or the air-supply boost system). In flight, the water system is pressurized by the bleed air.
Potable water is piped to the galleys and lavatories. Manual shutoff valves ❄ isolate wet galleys, the FWD lavatory (or the MID lavatory) and the aft lavatory from the water system. Manual shutoff valves are located under the washbasins or toilet bowls. The position of each valve is indicated by OPEN and SHUT legend.
The system can be filled or drained from the service panel at the bottom of the fuselage. The indication of the water quantity in the water tank is displayed on the FAP and the aft service panel.

Ident.: DSC-38-10-A-00017286.0002001 / 28 MAY 20
2 **Applicable to: MSN 01143-01518, 01593-01628, 01825, 01832, 02014, 02734, 02896-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 04441-04544, 04827-04974, 05066, 05101-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

Potable water is stored in a 200 l water tank located in front of the wing box, behind the FWD cargo compartment.
On ground, the water system is pressurized by the air from the service panel pressure port (or the air-supply boost system). In flight, the water system is pressurized by the bleed air.
Potable water is piped to the galleys and lavatories. Manual shutoff valves ❄ isolate wet galleys, the FWD lavatory (or the MID lavatory) and the aft lavatory from the water system. Manual shutoff valves are located under the washbasins or toilet bowls. The position of each valve is indicated by OPEN and SHUT legend.
The system can be filled or drained from the service panel under the fuselage. The indication of the water quantity in the water tank is displayed on the FAP and the aft service panel.

WASTEWATER SYSTEM

Ident.: DSC-38-10-00017287.0001001 / 21 MAR 16
Applicable to: ALL

The waste/water (from galleys and lavatories) drains overboard through two heated drain masts. The forward mast drains the waste/water from the forward cabin. The aft mast drains the waste/water from the aft cabin.

The waste and water are discharged by:
- Gravity, on ground
- Differential pressure, in flight.

TOILET SYSTEM

Ident.: DSC-38-10-00017288.0002001 / 21 MAR 16
Applicable to: ALL

Differential pressure forces the waste from the toilet bowls into the waste tank. The waste tank has a usable capacity of 170 l. On ground, and in flight below 16 000 ft , the differential pressure is generated by the vacuum generator.
Clean water from the potable water system flushes toilets.

A flush control unit controls the flush sequence in each toilet.
The Vacuum System Controller (VSC) ensures system control, monitoring and fault reporting.

The VSC transmits information to:
- Flight attendant panel to indicate the waste tank levels and report system defects
- Centralized Fault Display System (CFDS) to signal the system defects to the maintenance.

Ground personnel services the waste tank via a service panel, located under the fuselage.
A manual shutoff valve isolates an inoperative toilet. In the case of an electrical failure of flush valve, the manual flush control ◁✻ can be used. The manual flush control is located under each toilet bowl.

Intentionally left blank

GENERAL

Ident.: DSC-45-10-00001490.0001001 / 21 MAR 16
Applicable to: ALL

The purpose of the Centralized Fault Display System (CFDS) is to make the maintenance task easier by displaying fault messages in the cockpit and permitting the flight crew to make some specific tests.

There are two levels of maintenance :

at the line stop	:	removal and replacement of equipment
at the main base	:	troubleshooting

COMPONENTS

Ident.: DSC-45-10-00001491.0001001 / 21 MAR 16
Applicable to: ALL

The CFDS includes :
- the BITE (Built-In Test Equipment) for each electronic system
- a central computer, the Centralized Fault Display Interface Unit (CFDIU)
- two MCDUs (Multipurpose Control and Display Units), used also for FMGS (Flight Management and Guidance System), AIDS (Aircraft Integrated Data System), and ACARS (Aircraft Communication And Reporting System, if installed), which work with the CFDIU to display information or initiate tests
- one printer.

If a main channel of the CFDIU fails, the backup channel takes over.

MODES OF OPERATION

Ident.: DSC-45-10-00001492.0001001 / 22 MAR 16
Applicable to: ALL

The CFDS operates in two main modes :
- the NORMAL mode or REPORTING mode (in flight)
- the INTERACTIVE mode or MENU mode (on ground).

In NORMAL mode, the CFDS records and displays the failure messages transmitted by each system BITE.
In INTERACTIVE mode, the CFDS allows any BITE to be connected with the MCDU in order to display the maintenance data stored and formatted by the BITE or to initiate a test.

FAILURE/FAULT CLASSIFICATION

Ident.: DSC-45-10-00017082.0001001 / 21 MAR 16
Applicable to: ALL

The Centralized Fault Display System (CFDS) identifies the faulty system and puts any failures or faults into one of three classes :

Class 1 : Failures indicated to the flight crew by means of the ECAM, or other flight deck effect. They must be repaired or entered in the MEL (Minimum Equipment List) before the aircraft can depart.

Class 2 : Faults indicated to maintenance personnel by the CFDS and which trigger a MAINT status entry on the maintenance part of the ECAM status page. The aircraft can operate with these faults, but they must be rectified within the timescale defined in the Trouble Shooting Manual (TSM).

Class 3 : Faults indicated to maintenance personnel by the CFDS, but which do not trigger a MAINT status. The operator may have these faults corrected at his convenience.

Failure/fault classes	Class 1	Class 2	Class 3
Operational consequences	YES	NO	NO
Indication to the flight crew	YES Automatically displayed - Warning or caution messages on Engine Warning Display - Flag or indication in the flight deck.	YES Available on ECAM status page.	NO
Dispatch consequences	Refer to MEL may be : "GO" "GO IF" "NO GO"	*Refer to MMEL/MI-00-08 ECAM and MAINTENANCE STATUS*	MEL not applicable
Indication to the maintenance team	YES Automatically print out at the end of each flight : Fault messages on the CFDS Post Flight Report.		YES Available on request through system report/Test

FUNCTIONS OF THE CENTRALIZED FAULT DISPLAY SYSTEM (CFDS)

Ident.: DSC-45-10-00001495.0001001 / 21 MAR 16
Applicable to: MSN 01251-01459

The main functions of the CFDS are :

- obtaining and storing messages transmitted by the connected system BITEs, or by the Flight Warning Computer (Warning and Caution titles)
- Detailing the maintenance phases.

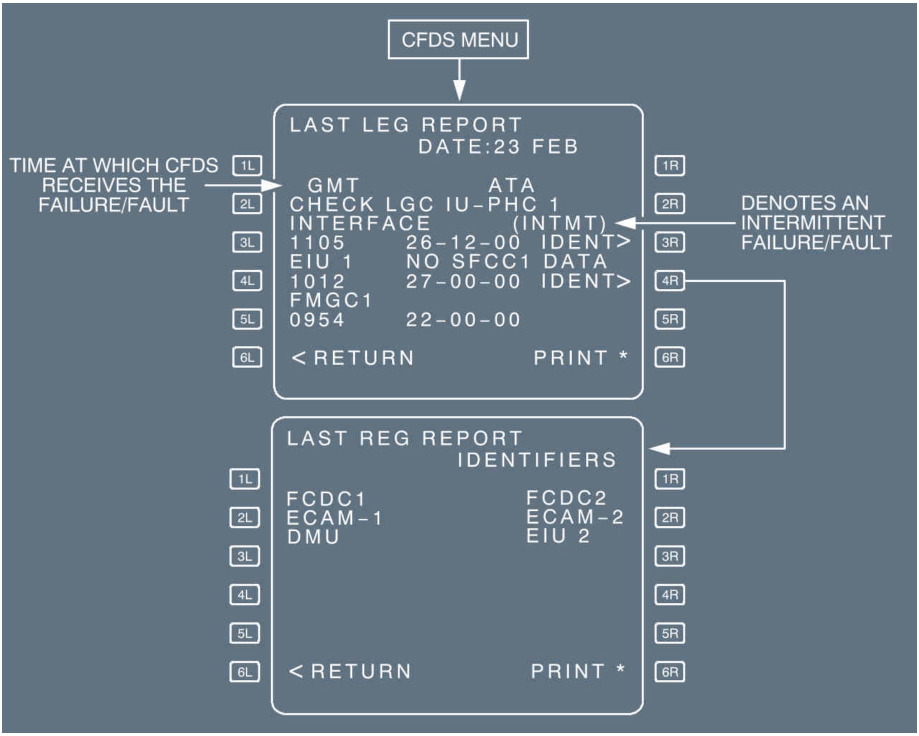
LAST (OR CURRENT) LEG REPORT

Ident.: DSC-45-20-00001498.0001001 / 21 MAR 16
Applicable to: ALL

The LAST LEG REPORT (on the ground) or the CURRENT LEG REPORT (in flight), list all class 1 failures and class 2 faults and all system failure and system fault messages received by the CFDS during the last flight leg or the current flight leg. Pressing the IDENT key displays a list of the systems (called identifiers) affected by the failure or fault, which helps the pilot or maintenance person to identify the failure or fault.



TIME AT WHICH CFDS RECEIVES THE FAILURE/FAULT

DENOTES AN INTERMITTENT FAILURE/FAULT

In the above example, the operator has called up menus of the selected systems :

- LAST or PREVIOUS LEG REPORT presents the list of Line-Replaceable Units (LRUs) affected by a failure.
- LRU IDENTIFICATION contains the part numbers of all LRUs in the system.
- GND SCANNING runs the flight monitoring on the ground and indicates the faulty LRU.
- CLASS 3 FAULTS lists class 3 faults detected by the system during the last flight leg.
- SYSTEM CONFIGURATION presents the system configuration in a digital form.

Note: *These screens (except LAST or PREVIOUS LEG REPORT) are not shown above.*

GMT/DATE INITIALIZATION

Ident.: DSC-45-20-00001504.0001001 / 21 MAR 16
Applicable to: ALL

A CFDIU clock is synchronized with the cockpit clock in order to keep GMT (UTC) displayed on the ECAM lower display (except in flight Phases 1 and 2, if the weight and balance system is installed). If the cockpit clock fails, the CFDIU clock continues to display GMT (UTC) on the ECAM lower display.

If electrical power is interrupted for more than 200 ms, the crew initializes GMT (UTC) and the DATE via the MCDU :
- Write GMT (UTC) in the scratchpad, then press the “INIT GMT” key.
- Do the same for the month and day.

BACKUP MODE

Ident.: DSC-45-20-00017066.0001001 / 21 MAR 16
Applicable to: ALL

If the main channel of the CFDIU fails, the backup channel allows the CFDS to operate in backup mode :

- On the ground only
- Through MCDU1 or MCDU3 ◁
- In one mode of operation only : SYSTEM REPORT/TEST
- Without the PRINTER or ACARS.

The system changes over from main channel to backup channel :

- Automatically in case of an important failure (power supply, for example). In this case, when the operator selects CFDS on the MCDU MENU, it displays the BACKUP MODE page.
- Manually if the operator selects BACKUP MODE on the CFDS menu after a minor failure.

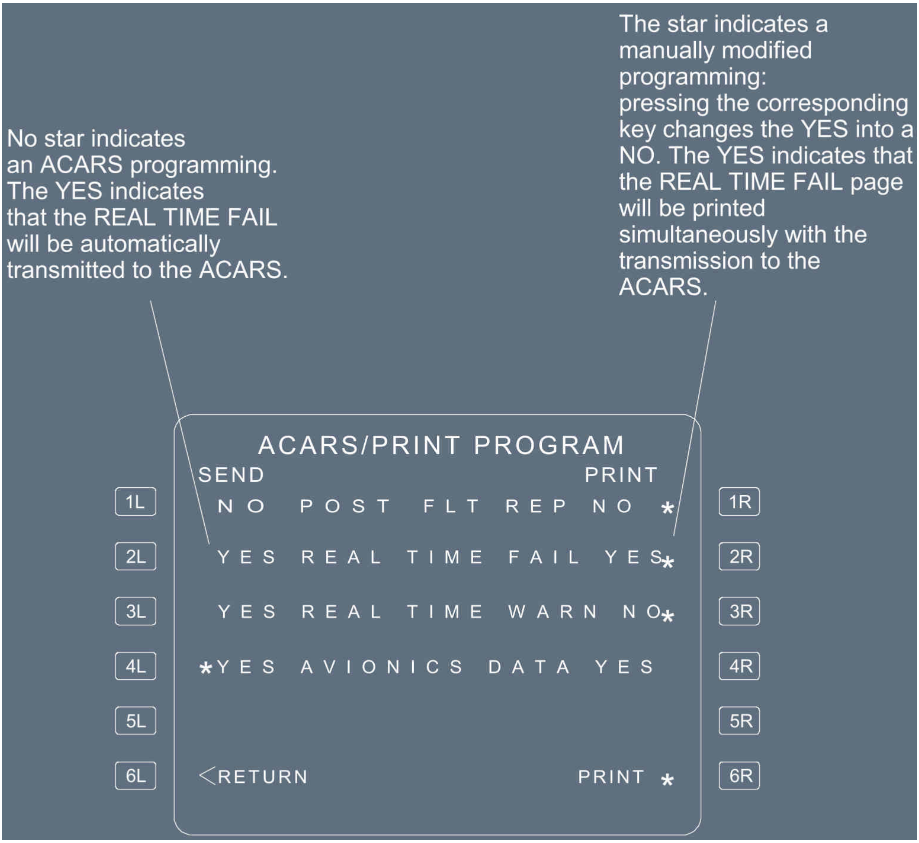
ACARS PRINT PROGRAM

Ident.: DSC-45-20-00005361.0001001 / 14 FEB 11
Applicable to: ALL

This function gives access to reprogramming page.
The programming is provided by the ACARS or manually (on the ground or in flight) :



No star indicates an ACARS programming. The YES indicates that the REAL TIME FAIL will be automatically transmitted to the ACARS.

The star indicates a manually modified programming: pressing the corresponding key changes the YES into a NO. The YES indicates that the REAL TIME FAIL page will be printed simultaneously with the transmission to the ACARS.

```
        ACARS/PRINT PROGRAM
SEND                            PRINT
 NO   POST  FLT  REP    NO          *
 YES  REAL  TIME  FAIL  YES         *
 YES  REAL  TIME  WARN  NO          *
*YES  AVIONICS  DATA    YES

<RETURN                        PRINT *
```

<u>Note:</u> The CFDIU memorizes all manual programming so that at initialisation the last configuration will be retained.

With the data loading system, it is possible to upload databases and operational software, or to download system reports from various onboard computers.
The data transfer is performed via 3.5 in disks and a portable data loader, or the aircraft fixed Multipurpose Disk Drive Unit (MDDU).

GENERAL

Ident.: DSC-45-25-00001506.0003001 / 09 NOV 21
1 **Applicable to: MSN 10949-11597**

The data loading system is an interface between aircraft systems and ground-based data processing stations.

The data loading system enables:
- To upload database or to modify operational software in aircraft systems
- To download system reports from various aircraft systems.

The connection between the data loading system and the ground-based data processing is performed via the DLSU on the center pedestal. The DLSU enables to guide data to and from selected aircraft systems.

OVERVIEW

Ident.: DSC-46-10-10-00020333.0001001 / 26 NOV 19

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 05005-05987, 06097, 06121, 06139-09324, 10949-11597**

The datalink has:
- AOC applications ◁

L2 The flight crew uses the AOC applications to communicate with Airline Operational Center (AOC).

L1
- ATC applications ◁

L2 The flight crew uses the ATC applications to communicate with Air Traffic Control (ATC) centers.

L1 The ATC datalink provides communication, navigation, and surveillance for Air Traffic Management (ATM) services.
The ATC datalink applications enable air traffic controllers to follow the aircraft navigation, and enhance the air traffic flow.

The datalink communication (messages exchange) between the aircraft and the ground is achieved:
- Automatically (without a flight crew action)
- Manually (with a flight crew action via the DCDU/MCDU and/or RMP).

The datalink messages are:
- Uplink (from a ground facilities to the flight crew), or
- Downlink (from the flight crew to an ground facilities).

COMMUNICATION AND NAVIGATION FOR AIR TRAFFIC MANAGEMENT

At the beginning of the flight, the flight crew sends a notification message to the ATC center, via the MCDU, notification application ◁ .
Then, an air traffic controller will establish a connection between the aircraft and the ATC center. As a result, the flight crew can exchange messages with the ATC center, via the DCDU (CPDLC application ◁). The messages that the flight crew sends to the ATC center can be built with present frames and modified via the MCDU.

Depending on the type of datalink exchange, the datalink uses one of the following communication networks:
- ACARS for FANS A ◁ applications
- ACARS Air Traffic Services (ATS 623) for optional applications ◁
- Aeronautical Telecommunication Network (ATN) for FANS B ◁ applications

L2 The ATN supports increasing volume of ATC and AOC communication.

L1 _Note:_ *FANS A+ ◁ (FANS B+ ◁) is an evolution of the FANS A ◁ (FANS B ◁) that introduces ATS 623 applications and datalink recording capability.*

FUTURE AIR NAVIGATION SYSTEM (FANS)

The ATC datalink provides:
- FANS A ◁ Applications, for operations in remote and in oceanic areas:
  - Notification
  - Controller-Pilot Data Link Communication (CPDLC)
  - Automatic Dependent Surveillance Contract (ADS-C).
- FANS B ◁ Applications, for operations in high-density continental areas:
  - Notification
  - Controller-Pilot Data Link Communication (CPDLC).
- Optional applications ◁ (compatible only with FANS A+ or FANS B+):
  - Departure Clearance
  - Oceanic Clearance
  - Digital - Automatic Terminal Information Service (D-ATIS).

NAVIGATION AND SURVEILLANCE FOR AIR TRAFFIC MANAGEMENT

The Automatic Dependent Surveillance (ADS) system sends aircraft position and aircraft navigation data to ATC centers and other aircraft.

There are two different ADS applications:
- ADS-Contract (ADS-C) ◁
  The ADS-C automatically sends aircraft surveillance data to connected ATC centers via ATC Datalink ◁ in remote or oceanic areas.
- ADS-Broadcast (ADS-B) ◁
  The ADS-B automatically broadcasts the aircraft position and navigation data to other users (ATC centers or other aircraft) equipped with a Mode S transponder. The ATC Datalink ◁ does not host the ADS-B ◁ .

SERVICE PROVIDERS

The role of a communication service provider is to deliver a message from the A/C to a ground end system and vice versa.
A datalink service provider ensures routing of datalink messages between the aircraft and ATC center.

L2 For VHF communication, the two main providers are ARINC and SITA that operate worldwide networks.

L1 REVERSION TO VOICE COMMUNICATION

Voice communication is a primary means of communication on board.

The flight crew must revert from datalink communication to voice communication, if:
- There is an emergency situation (exchange of a critical or urgent message)
- There is a doubt about a datalink message, the voice should be used for clarification
- An operational timer of datalink message exchange times out
- A response to an ATC message was not correctly transmitted via datalink.

CLOCK ACCURACY

The required time precision for ATC datalink communications is +/-1 s UTC. If this constraint is not respected, a rejection of datalink message or acceptance of obsolete datalink message may occur.
Not respecting this constraint may lead to the rejection of messages or to the acceptance of obsolete messages.
For FANS operations, the flight crew should not manually set the clock during cockpit preparation.

OVERVIEW

Ident.: DSC-46-10-10-00020333.0002001 / 26 NOV 19
Applicable to: MSN 04827-04974

The datalink has:
- AOC applications ◁

L2 The flight crew uses the AOC applications to communicate with Airline Operational Center (AOC).

L1
- ATC applications ◁

L2 The flight crew uses the ATC applications to communicate with Air Traffic Control (ATC) centers.

L1 The ATC datalink provides communication, navigation, and surveillance for Air Traffic Management (ATM) services.
The ATC datalink applications enable air traffic controllers to follow the aircraft navigation, and enhance the air traffic flow.

The datalink communication (messages exchange) between the aircraft and the ground is achieved:
- Automatically (without a flight crew action)
- Manually (with a flight crew action via the DCDU/MCDU and/or RMP).

The datalink messages are:
- Uplink (from a ground facilities to the flight crew), or
- Downlink (from the flight crew to an ground facilities).

COMMUNICATION AND NAVIGATION FOR AIR TRAFFIC MANAGEMENT

At the beginning of the flight, the flight crew sends a notification message to the ATC center, via the MCDU, notification application ◁ .
Then, an air traffic controller will establish a connection between the aircraft and the ATC center.
As a result, the flight crew can exchange messages with the ATC center, via the DCDU (CPDLC

application ◁). The messages that the flight crew sends to the ATC center can be built with present frames and modified via the MCDU.

Depending on the type of datalink exchange, the datalink uses one of the following communication networks:

- ACARS for FANS A ◁ applications
- ACARS Air Traffic Services (ATS 623) for optional applications ◁
- Aeronautical Telecommunication Network (ATN) for FANS B ◁ applications
  L2 The ATN supports increasing volume of ATC and AOC communication.

L1 *Note:* *FANS A+ ◁ (FANS B+ ◁) is an evolution of the FANS A ◁ (FANS B ◁) that introduces ATS 623 applications and datalink recording capability.*

ATC DATALINK COMMUNICATION

The ATC datalink provides:

- FANS B applications (ATN B1 in ICAO designation) using ATN ground network, for operations in high-density continental areas:
  - Notification
  - Controller-Pilot Data Link Communication (CPDLC).

NAVIGATION AND SURVEILLANCE FOR AIR TRAFFIC MANAGEMENT

The Automatic Dependent Surveillance (ADS) system sends aircraft position and aircraft navigation data to ATC centers and other aircraft.

There are two different ADS applications:

- ADS-Contract (ADS-C) ◁
  The ADS-C automatically sends aircraft surveillance data to connected ATC centers via ATC Datalink ◁ in remote or oceanic areas.
- ADS-Broadcast (ADS-B) ◁
  The ADS-B automatically broadcasts the aircraft position and navigation data to other users (ATC centers or other aircraft) equipped with a Mode S transponder. The ATC Datalink ◁ does not host the ADS-B ◁ .

SERVICE PROVIDERS

The role of a communication service provider is to deliver a message from the A/C to a ground end system and vice versa.
A datalink service provider ensures routing of datalink messages between the aircraft and ATC center.
L2 For VHF communication, the two main providers are ARINC and SITA that operate worldwide networks.

L1 REVERSION TO VOICE COMMUNICATION

Voice communication is a primary means of communication on board.

The flight crew must revert from datalink communication to voice communication, if:
- There is an emergency situation (exchange of a critical or urgent message)
- There is a doubt about a datalink message, the voice should be used for clarification
- An operational timer of datalink message exchange times out
- A response to an ATC message was not correctly transmitted via datalink.

CLOCK ACCURACY

The required time precision for ATC datalink communications is +/-1 s UTC. If this constraint is not respected, a rejection of datalink message or acceptance of obsolete datalink message may occur.
Not respecting this constraint may lead to the rejection of messages or to the acceptance of obsolete messages.
For FANS operations, the flight crew should not manually set the clock during cockpit preparation.

Applicable to: MSN 04827-04974

AIR DATA/INERTIAL REFERENCE SYSTEM (ADIRS)

The ADIRS provide aircraft position data to the FMGC. The FMGC consolidates the position value from different sources and transmits it to the ATSU. This is the primary source for the aircraft position.

Ident.: DSC-46-10-10-10-00020329.0001001 / 17 MAR 17
Applicable to: ALL

AIR TRAFFIC SERVICE UNIT (ATSU)

The ATSU controls all datalink communication and automatically selects the best available communication media:
- VHF
- HF ◁
- SATCOM ◁ .

The ATSU hosts:
- AOC applications ◁
- ATC applications ◁
- Router services
  The ATSU routers automatically select VHF frequency, depending on the aircraft position, in accordance with an entered scan mask (airline policy).
  The scan mask means that a list of VHF datalink service providers, selected via the VHF3 SCAN SELECT page, is scanned, in accordance with their priority level. The VHF scan mask is compulsory for correct router operation. If there is no scan mask, the ECAM displays DATALINK ATSU FAULT – ATSU INIT FAULT.
  Refer to DSC-46-10-40-30 VHF3 SCAN SELECT for more information about the VHF3 SCAN SELECT page.

Ident.: DSC-46-10-10-10-00020330.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

DATALINK CONTROL AND DISPLAY UNIT (DCDU)

The DCDU enables the flight crew to:

- Read and answer datalink messages, received from the ground
- Display datalink messages, before sending.

Ident.: DSC-46-10-10-10-00020326.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

FLIGHT MANAGEMENT SYSTEM (FMS)

The ATC datalink interacts with Flight Management Computers (FMC).

The FMS:
- Processes datalink messages
- Prepares/generates an answer to datalink messages

- Monitors clearances
- Reminds the flight crew about a clearance, before reaching a clearance condition.
  When a monitored parameter reaches the assigned value, the FMS generates a reminder message via the DCDU.

Ident.: DSC-46-10-10-10-00020331.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

FLIGHT WARNING SYSTEM (FWS)

The FWS interacts with the ATSU and:

- Alerts, when a datalink message is received
- Alerts, in the case of detected failures
- Inhibits alerts, depending on the flight phase.

Ident.: DSC-46-10-10-10-00021433.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

GLOBAL POSITIONING SYSTEM (GPS)

The GPS provides the position information to the FMGC. The position information is consolidated with the ADIRS data and sent to the ATSU.
The GPS also enables time synchronization to the clock, in order to provide UTC date and time for datalink system. If the GPS fails, the clock continues to calculate the time by incrementing the last received pertinent information as the reference time.

Ident.: DSC-46-10-10-10-00020322.0001001 / 17 MAR 17
2 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

HIGH FREQUENCY (HF) ◁

The HF communication system ◁ has:
- Data mode
- Voice mode.

HF communication system ◁ can be used in the data mode as an alternative to VHF 3 and SATCOM ◁ . In this case, the communication between the aircraft and HF ground stations is established on a HF frequency. A HF frequency of HF DataLink (HFDL) is tuned automatically.

DATALINK/VOICE SWITCHING

The HF ◁ can be used in the voice mode. The flight crew can switch datalink/voice and set a voice frequency via the RMP.
Green HF VOICE memo indicates that HF datalink communication is interrupted, when the HF transceiver operates in the voice mode.

Ident.: DSC-46-10-10-10-00020328.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

MULTI-PURPOSE CONTROL AND DISPLAY UNIT (MCDU)

The MCDU enables the fight crew to access functions to:

- Manage the ATC datalink connections
- Send notifications
- Edit datalink messages
- Consult reports
- Access Message Record application.

Ident.: DSC-46-10-10-10-00021339.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

PRINTER

The flight crew can print ATC messages, displayed on the DCDU, or the MCDU.

Note: *Each time the flight crew prints a message, they must check that the printed message is identical to the message on the display unit.*
The reference information is the information, that the display unit displays.

Ident.: DSC-46-10-10-10-00020327.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

RADIO MANAGEMENT PANEL (RMP)

The flight crew sets a radio frequency into the RMP, when a specific datalink message (e.g.: CONTACT, MONITOR, ...) is received, or when a voice contact is required.

Ident.: DSC-46-10-10-10-00021236.0002001 / 21 MAR 17
Applicable to: MSN 04827-04974

Frequencies that some datalink messages contain, can be loaded into RMP via LOAD pb of the RMP.

Ident.: DSC-46-10-10-10-00020319.0001001 / 17 MAR 17
Applicable to: ALL

SATELLITE COMMUNICATIONS (SATCOM) ◁

The SATCOM system ◁ provides voice and data services. The voice/data are transmitted via satellite, from the aircraft to the ground earth stations, and then switched through international telecommunications networks (ARINC, SITA, etc.) to anywhere in the world (airline operational centers, ATC centers, etc).
The ATSU (router) manages switching to/from SATCOM ◁ (ACARS environments only).

Ident.: DSC-46-10-10-10-00020324.0002001 / 17 MAR 17
Applicable to: MSN 04827-04974

SURVEILLANCE SYSTEMS (SURV)

The ATC datalink system interacts with the surveillance system and enables the flight crew to:
- Provide the ATC center with a TCAS status, sent via the ADS application
- Provide the ATC center with the SQUAWK code as a response to CONFIRM SQUAWK uplink message.

Ident.: DSC-46-10-10-10-00020321.0001001 / 28 MAY 20
Applicable to: MSN 04827-04974

VERY HIGH FREQUENCY (VHF)

The communication between the aircraft and VHF ground stations is established on a VHF frequency. The datalink system primarily uses VHF 3 communication system. The ATSU router automatically selects a VHF frequency, depending on entered configuration, the scan mask for VHF DataLink (VDL), and the aircraft position.
VHF data link service providers are available in each geographical area.

The VHF3 radio communication system has:
- Data mode
- Voice mode.

DATALINK/VOICE SWITCHING

The VHF 3 can be used in the voice mode, in case of:
- VHF 1 failure
- VHF 2 failure
- Specific AOC functions (operator's customization).

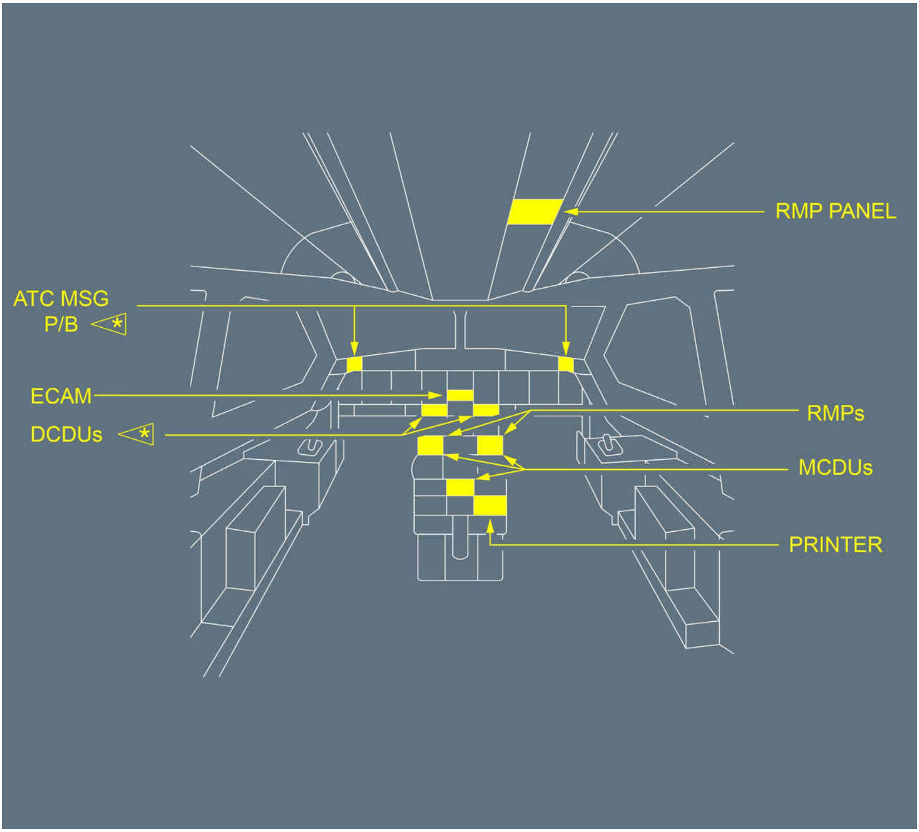
The flight crew can switch datalink/voice via the RMP, or via VHF3 VOICE DIRECTORY page of the MCDU.

The voice frequency can be tuned by:
- ATSU automatically
- Fight crew, via the RMP.

Green HF VOICE memo indicates that VHF 3 datalink communication is interrupted, when the VHF 3 transceiver operates in the voice mode.

COCKPIT INTERFACE

Ident.: DSC-46-10-10-00020373.0001001 / 17 MAR 17
Applicable to: ALL



The cockpit interface of the datalink system has:

- Datalink Control and Display Unit (DCDU) ◁* on the CAPT and F/O side
  The DCDU displays the uplink and downlink messages and enable the flight crew to control the datalink message exchange.
- ATC MSG pb-sw ◁* on the CAPT and F/O side of the glareshield
  The ATC MSG pb-sw alerts when an uplink message is received and enables the flight crew to cancel the alert.

- Multipurpose Control and Display Unit (MCDU)
  The MCDU enables to manage AOC and ATC functions and data transfer to the DCDU ⊲
- Printer
  Datalink messages can be printed, when displayed on the DCDU.
- RMP
  The RMP enables frequency tuning.
- ECAM
  The ECAM informs about the abnormal operation.

DATALINK MESSAGE

Applicable to: MSN 04827-04974

Ident.: DSC-46-10-10-30-00020966.0001001 / 17 MAR 17

UPLINK MESSAGE RECEPTION

When a datalink message is received, the flight crew reads, and manages the messages on the DCDU. The status of received message is OPEN, and changes during processing. Urgent messages or messages with higher priority are automatically displayed to the flight crew.
If a normal message is displayed on the DCDU, when receiving an urgent message, the DCDU will display the urgent message. The normal message stays in the file queue. The flight crew can retrieve the normal message by pressing MSG+/MSG- keys.

Ident.: DSC-46-10-10-30-00020374.0001001 / 17 MAR 17

UPLINK MESSAGE RECEPTION ALERT

The flight crew is alerted, when a datalink message is received. A dedicated aural alert activates and the ATC MSG pb-sw illuminates on CAPT side and on F/O side.

Note: *The ATC chime is triggered:*
- *Every 15 s, if a normal datalink message is received*
- *Every 5 s, if an urgent datalink message is received*

These cockpit alerts stop, if one of the ATC MSG pb-sw is pushed, or if the flight crew answers the datalink message via the DCDU.

Note: *ATC datalink alerts are inhibited during takeoff and landing phases.*

When a normal datalink message is received, this message will appear on the DCDU screen, if the screen is empty. If the DCDU screen is not empty, this message will not appear on the screen automatically, and the MSG (number) will flash in the information field of the DCDU.
When an urgent datalink message is received, this message will automatically appear on the DCDU screen.

Ident.: DSC-46-10-10-30-00020968.0001001 / 17 MAR 17

UPLINK MESSAGE RESPONSE

The flight crew can answer to an ATC datalink message:

- Directly
  Several types of datalink messages enable the flight crew to answer directly, via the DCDU. The flight crew can launch preparation of a response message by pressing an appropriate function key (e.g.: WILCO, ROGER, AFFIRM, NEGATIVE, ...), on the DCDU. Consequently, the FMGS will generate a response message on the DCDU. The flight crew can send prepared response message to the ATC by pressing SEND function key of the DCDU.
- Indirectly
  Datalink messages that cannot be answered directly via the DCDU, are prepared on the MCDU. The flight crew selects the appropriate function key (EDIT or MODIFY), on the DCDU, in order to display desired MCDU page (EDIT or MESSAGE MODIFY page). The flight crew enters relevant values and information for the response via the page of the MCDU.
  When desired information is inserted, the flight crew must transfer the information from the MCDU to the DCDU, by pressing appropriate key on the MCDU. Consequently, prepared response message appears on the DCDU.

If the prepared downlink message has more than one page, the flight crew must display, and review all pages of the message on the DCDU, before the message is sent to the ATC. When the flight crew displays all pages of the message, an asterisk (*) appears next to SEND function key of the DCDU. The asterisk (*) indicates that the function key is active, and the function can be used.
If the flight crew cannot answer to an ATC uplink message immediately, a stand-by (STBY) message can be sent to the ATC. When a STBY response message is sent, the message status, displayed on the DCDU, changes to STBY. This message cannot be removed from the DCDU, until the flight crew sends a final response later on.
When a downlink message is successfully sent, the message information area will indicate SENT and the color code of the message will change.

EXAMPLE	Clearance message: The flight crew can answer positively, by selecting WILCO* See (1) and send the message to the ATC, by selecting SEND* See (2) on the DCDU. SENDING appears in the information area of the DCDU, when SEND* is selected. SENT appears in the information area of the DCDU, when the message is successfully sent.

DOWNLINK MESSAGE CREATION

The flight crew can also create and send a request to the ATC.

A request message created by the flight crew and sent to ATC has:
- Cyan (blue) background before sending
- Green background, after sending.

EXAMPLE	Request message: The flight crew can send prepared message to the ATC by selecting SEND* See (1) on the DCDU. SENDING appears in the information area of the DCDU, when SEND* is selected. SENT appears in the information area of the DCDU, when the message is successfully sent.

- *Sending multiple clearance requests in the same message.*
- *Re-sending a message, if the ATC does not answer immediately.*

Ident.: DSC-46-10-10-30-00021458.0001001 / 17 MAR 17

CLOSING AND REMOVAL OF THE MESSAGE FROM THE DCDU

When the flight crew sends the datalink message via the DCDU, The message should be closed, by pressing the CLOSE function key. Closing the message will clean the DCDU screen.

Ident.: DSC-46-10-10-30-00020972.0001001 / 17 MAR 17

The RECALL function key of the DCDU can be used to display the last closed message.
Other messages can be viewed on the MSG RECORD page of the MCDU .

Note: *Before each flight, the MSG RECORD file of previous flight should be erased.*

Ident.: DSC-46-10-10-30-00021192.0001001 / 21 MAR 17

AUTO-CLOSING

The message closes and the system automatically removes the message from the DCDU, 5 s after the ATC center successfully receives the message.
Clearance messages and messages, related to loss of communication or datalink transmission error, do not close automatically, when sent or received by the ATC. The flight crew must close these messages by pressing the CLOSE key, on the DCDU. Closing the message will remove the message from the DCDU screen.

Intentionally left blank

General

GENERAL

Ident.: DSC-46-10-20-10-00020385.0001001 / 17 MAR 17
Applicable to: ALL

The AOC applications ◁ are datalink applications. The AOC applications enable an exchange of specific messages between the flight crew and the Airline Operational Control (AOC).
The AOC applications are customized by each operator and depend on operator's choices and the datalink service provider.

Note: *Details about AOC applications cannot be provided due to the wide range of customization by the operator.*
Airbus does not supervise customization of AOC applications. It is recommended to insert AOC application description into this chapter in accordance with AOC applications installed on the aircraft.

The AOC applications can offer the following functions:

EXAMPLE

- Preflight Functions:
  - Flight log
  - Departure Delay Message
  - Takeoff Delay Message
  - Weather Request
  - NOTAM Request
  - Loadsheet Request
  - Others
- En-Route Functions:
  - Flight log
  - Diversion Message
  - En-route Delay
  - Estimated Time of Arrival (ETA) Message
  - Weather Request
  - NOTAM Request
  - Others
- Postflight Functions:
  - Flight log
  - Flight summary
  - Gate delay
  - Others

The flight crew uses the datalink cockpit interface for the AOC applications.

EXAMPLE	**Flight Plan Modification** This flight plan modification example is based on following assumptions: - The AOC sends a flight plan modification message to the flight crew. - The flight crew loads the fight plan modification in the FMGS, into the secondary F-PLN. - The crew obtains ATC clearance before activating the modified flight plan. - *Refer to DSC-46-10-50 How to Modify FLT Plan* for the flight plan modification based on an AOC request.

Notifications

NOTIFICATION

Ident.: DSC-46-10-30-10-00020375.0001001 / 03 NOV 22
Applicable to: MSN 04827-04974

The Notification application enables the flight crew to send a notification message to an ATC center, if the datalink system is correctly initialized.
Refer to DSC-46-10-50 How to Initialize for more information about datalink initialization.
The flight crew must notify the ATC center, from 15 min to 45 min, before entering the ATC area.
The flight crew notifies a desired ATC center via the NOTIFICATION page of the MCDU.
However, ATC centers initiate automatic notification, when the aircraft flies from one ATC area to another.

Note: *The ATC center initiates a CPDLC connection, when the flight crew sends the notification. The NOTIFICATION page of the MCDU will display “XXXX NOTIFIED HHMM Z”). Therefore, it is not necessary to repeat notifications to the ATC center.*

The notification procedure enables the ATC to correlate the aircraft with the ICAO flight number.

Note: *The FMGC provides the FLT number.*

Consequently, it is essential to enter, into the FMGC, via the INIT page of the MCDU, the same flight number as the flight number, indicated on the ICAO flight plan (with the same number of letters).
ATS623 ◁ applications (Departure CLearance (DCL), OCL and D-ATIS) do not require previous notifications, or connection to an ATC center.

ATS623 ◁ applications workflow are based on equivalent voice exchanges:
1. Request - crew requests
2. Clearance - ground clears
3. Read-back - crew reads back
4. Confirmation - ground confirms.

Intentionally left blank

Controller/Pilot Datalink Communication (CPDLC)

GENERAL

Applicable to: MSN 04827-04974

Ident.: DSC-46-10-30-20-10-00020376.0001001 / 17 MAR 17

The CPDLC application enables an exchange of specific ATC messages between the flight crew and air traffic controller.
The air traffic controller initiates the CPDLC connection with the aircraft, after the reception of a notification message from the flight crew.

Note: *When the aircraft flies from one air traffic control area to another, the CPDLC ensures an automatic transfer of ATC centers.*

The flight crew and air traffic controller use a set of predefined messages to build datalink messages. The flight crew and air traffic controller can also send freetext datalink messages. Freetext messages can only be used, when pre-formatted datalink messages do not allow to send the information.

Note: *The freetext message does not allow the datalink system to generate automatic pre-formatted answer.*
The freetext message must contain standard ATC phraseology and standard abbreviations.

The CPDLC application enables the flight crew to answer following uplink messages via the DCDU:
- Clearance
- Report request
- Negotiation message
- Information message.

Ident.: DSC-46-10-30-20-10-00021043.0002001 / 05 JUN 18

The CPDLC application supports the following functions:
- Connection (Refer to DSC-46-10-30-20 Connection)
- Request (Refer to DSC-46-10-30-20 Request)
- Edit (Refer to DSC-46-10-30-20 Edit)
- Message Timer (Refer to DSC-46-10-30-20 Message Timer).

CONNECT

Ident.: DSC-46-10-30-20-00020998.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

The notified ATC center can initiate a CPDLC connection with the aircraft. This ATC center is then considered as active. The active ATC center appears on the DCDU, and on the MCDU, in the active ATC field of the CONNECTION STATUS page.

Only one ATC center can be active at a time.
During flight, the aircraft may move from one ATC area to another ATC area. The next ATC may anticipate this change. The next ATC center may initiate a passive connection with the aircraft, when the aircraft is still connected to the active ATC. In this case, the next ATC center appears on the DCDU, and on the MCDU, in the next ATC field of the CONNECTION STATUS page. When the ATC area changes, the active ATC center ends the connection with the aircraft, and the next ATC center automatically becomes the active ATC center.
The CONNECTION STATUS page of the MCDU displays ICAO codes of both, the active and the next (if any) ATC centers. The flight crew can manually disconnect the ATC centers via the CONNECTION STATUS page.
Refer to DSC-46-10-40-30 CONNECTION STATUS for information about the CONNECTION STATUS page.

REQUEST

Ident.: DSC-46-10-30-20-00021000.0002001 / 01 MAR 18
Applicable to: MSN 04827-04974

In the REQUEST page of the MCDU, the flight crew can request:

- Direct to
- Altitude / Flight Level
- Speed / Mach

Note: *Requests of the departure clearance, oceanic clearance and ATIS are not part of the CPDLC application.*

EDIT

Ident.: DSC-46-10-30-20-00021013.0002001 / 17 MAR 17
Applicable to: MSN 04827-04974

The EDIT function enables the flight crew to modify a downlink message before sending.
The flight crew can modify the message on the MCDU, before the message is sent to ATC center via the DCDU.

Note: *The EDIT page appears automatically on the MCDU, if the EDIT function key is pressed on the DCDU. Pressing EDIT also triggers MCDU FOR EDIT indication, in the message information area, on the DCDU.*

Refer to DSC-46-10-40-20 Message Information Area for information about MCDU FOR EDIT indication on the DCDU.
Refer to DSC-46-10-40-30 EDIT for more information about the EDIT page.

MESSAGE TIMER

Ident.: DSC-46-10-30-20-00021031.0003001 / 17 MAR 17
Applicable to: MSN 04827-04974

The message latency timer is a fixed time value. The message becomes invalid, after expiry of the message latency timer. The flight crew or air traffic controller cannot receive invalid datalink message.

DOWNLINK MESSAGE

The ATC center must receive the message in a limited time. The air traffic controller cannot see an invalid message. When an invalid message is not received by the air traffic controller, the DCDU displays an associated message (NO ATC REPLAY) to inform the flight crew.

UPLINK MESSAGE

The ATC center must transmit the message to the aircraft in a limited time. If the time difference between the time reference/timestamp in the message, and the reception of the message by the aircraft, exceeds the message latency time, the message is rejected. The DCDU will not display the message.
The flight crew must respond to an uplink message in a limited time. The flight crew may press STBY, in the case of an expected delay that exceeds the message timer.

Note: *The DCDU displays XXs FOR REPLAY, in the message information area, 30 s before the expiration of replay timer. This message informs the flight crew about the time that remains to the expiration of the message latency timer.*

When the uplink message timer expires (the flight crew did not respond within the limit), the DCDU displays REPLAY: TIME OUT, in the message information area. The message becomes invalid. An invalid uplink message can only be closed, and the flight crew reverts to voice communication, if a response to the message is required.

Intentionally left blank

Message Record

MESSAGE RECORD

Ident.: DSC-46-10-30-70-00020377.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

The Message Record application enables to store datalink messages. The flight crew can display the recorded messages at any time.

When the flight crew closes a message on the DCDU, the message is stored and disappears from the DCDU.

The messages are stored in chronological order and grouped by flight number. When the maximum number of stored messages is reached (up to 99 messages), any new message will be stored and the oldest message will be deleted.

The flight crew can access the stored message via the MSG RECORD page of the MCDU.

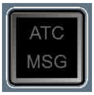
Note: *1. The flight crew can print recorded messages.*
2. The flight crew can erase all recorded messages.
3. The ADS-C ◁ reports are not stored.

Intentionally left blank

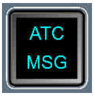
ATC Message Pushbutton (ATC MSG PB)

ATC MSG PB

Ident.: DSC-46-10-40-10-00021077.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974



No datalink message from the ATC center was received.



Flashes when a datalink message from the ATC center is received, or a reminder message is received. When a message is received, the DCDU automatically displays the message on the screen.
Associated with audio alert.
When the flight crew presses one of the two ATC MSG pbs, the ATC MSG lights go off and the aural alert associated with the reception of the message is cancelled.

Intentionally left blank

DATALINK MESSAGE AREA

Displays uplink and downlink messages.

Uplink messages are displayed on a black background, and:
- When received, the message appears in white and the main parameters in cyan.
- When answered, the message becomes green.

Downlink messages appear in black:
- On a cyan background before sending
- On a green background while and after sending.

Ident.: DSC-46-10-40-20-10-00021241.0001001 / 17 MAR 17

MESSAGE STATUS

Indicates the status of the message or the response of the flight crew to a message received from the active ATC center.

	The status of the message changes to AFFIRM, when the flight crew selects a positive answer to the ATC uplink message on the DCDU.
	The status of the message changes to AFFIRM, when the flight crew sends a positive answer to the ATC center.
	The status of the message changes to NEGATV, when the flight crew selects a negative answer to the ATC uplink message on the DCDU.
	The status of the message changes to NEGATV, when the flight crew sends a negative answer to the ATC center.
	The status of the message changes to ROGER, when the flight crew selects ROGER, in order to inform the ATC center that they received and understood the uplink message.
	The status of the message changes to ROGER, when the flight crew sends a ROGER answer to the ATC center.
	The status of the message changes to STBY, when the flight crew selects STBY, in order to inform the ATC center that they need time to answer the uplink message.
	The status of the message changes to STBY, when the flight crew sends a STBY answer to the ATC center.
	The status of the message changes to UNABLE, when the flight crew selects UNABLE, in order to inform the ATC center that they cannot comply with the request.
	The status of the message changes to UNABLE, when the flight crew sends a UNABLE answer to the ATC center.

WILCO	The status of the message changes to WILCO, when the flight crew selects WILCO, in order to inform the ATC center that they understood the request and that they will comply with it.
WILCO	The status of the message changes to WILCO, when the flight crew sends a WILCO answer to the ATC center.
OPEN	Indicates that the received uplink message requires a response. The status OPEN remains until the flight crew answers the uplink message.
OPEN	Indicates that: - The flight crew did not answer the uplink message in due time, or - The flight crew sent a downlink or a response message, but no acknowledgment from the ground was received.
ABORT	Indicates that a disconnection occurred during a pending uplink or downlink message.

Note: *The status field remains empty for:*
- *A downlink message sent to the active ATC center*
- *An uplink message for which no response is expected.*

Ident.: DSC-46-10-40-20-10-00021242.0004001 / 17 MAR 17

FUNCTION KEYS

Depending on the nature of the message, the system automatically displays an appropriate function by each function key.

Possible unctions are detailed below.

AFFIRM : When selected, prepares an affirmative response to accept an ATC negotiation message (e.g. CAN YOU ACCEPT [altitude] AT [time])..

ANSWER : When selected, prepares a default response to an uplink message with two or more confirm/open negotiation message elements.

CANCEL : When selected, enables the flight crew to:
- Remove a prepared downlink message from the DCDU
- Cancel a selected reply to an uplink message.

CANNOT : When selected, prepares a negative answer to an OPEN negotiation message from the ATC.

CLOSE : When selected, erases a message (from the DCDU screen) that was sent to the ATC, or erases a message from the ATC that was answered. This message is stored in the MSG RECORD. This is not applicable when the answer is on stand-by (STBY).

EDIT : When selected, accesses the EDIT page, on the MCDU.

NEGATIV : When selected, prepares a negative response to an ATC message.

RECALL	:	When selected, recalls the most recently closed message if it was closed within the last 5 min. If the flight crew selects the RECALL more than 5 min after the last message was closed, the RECALL EMPTY CONSULT MSG RECORD message appears.
ROGER	:	When selected, confirms the reception, and understanding of ATC information or report request.
SEND	:	When selected, sends a message or an answer, that was prepared by using other function keys (Example: WILCO, ROGER, AFFIRMATIVE, STBY, ...).
STBY	:	When selected, informs the ATC that the flight crew needs to delay the answer.
UNABLE	:	When selected, rejects an ATC clearance.
WILCO	:	When selected, accepts an ATC clearance.
*	:	The function keys are operative, if an asterisk or a function is visible.

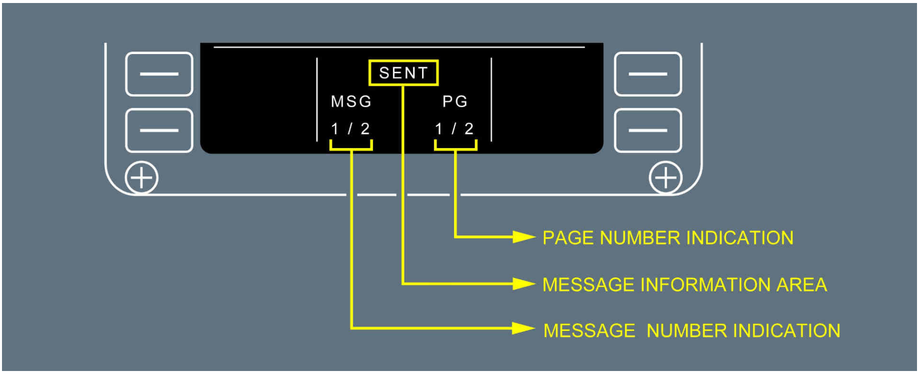
Message Information Area on the DCDU



MESSAGE NUMBER INDICATION

Indicates the rank of the message that is displayed on the DCDU.
If there is only one message on the DCDU, the message number information does not appear in the information field. In the case of a new message reception, the message number indication flashes.

PAGE NUMBER INDICATION

Indicates the page number of the message that is displayed on the DCDU.
If the message contains only one page, the page number information does not appear in the information field.

MESSAGE INFORMATION AREA

ANSWER MSG (amber) :	Maximum number of pending uplink messages is reached.
COM FAULT (amber) :	ATC communication means faulty.
COM NOT AVAIL (amber) :	Communication means temporarily unavailable.
COM NOT INIT (amber) :	Router not initialized.
FILE FULL (amber) :	Maximum number of downlink messages, accessible on the DCDUs, is reached.
LINK LOST (amber) :	Communication with the ATC is unavailable (displayed on any message pending when the loss occured).
MCDU FOR EDIT (white) :	Follows pressing of the “EDIT” key.
MCDU FOR TEXT (white) :	Follows pressing the “UNABLE“ key.
NO ATC DLK (white) :	ATC communication means temporarily unavailable.
NO ATC REPLY (amber) :	No answer received within 270 s.
NO MORE MSG (white) :	Follows pressing of the “MSG + “ or “MSG -” key, when no more messages are accessible.
NO MORE PGE (white) :	Follows pressing of the “PGE +” or “PGE -” key, when no more pages are accessible.
OVERFLW CLOSED (amber) :	Maximum number of non-pending messages is reached, and a new non-pending message is registered in the file.
PRINT FAILED (amber) :	Printing was requested from the DCDUs and printing failed.
PRINTING (white) :	Printing was requested from the DCDUs and printing is in progress.
PRINTING UNAVAIL (white) :	Printing was requested from the DCDUs, but the printer is unavailable.
RECALL EMPTY CONSULT MSG RECORD (white) :	If the flight crew has pressed the “RECALL“ key, and the last message was closed more than 5 minutes before.
RECALL MODE (white) :	If the flight crew has pressed the “RECALL“ key and the last message was closed within the last 5 minutes.
RECEIVD BY ATC (white) :	The current message has been received by the controller.

REJ BY ATC (amber) : Message rejected by the ATC system, controller not aware of this message.

REPLY: TIME OUT (amber) : Crew answers have to be delivered within 100 s.

SENDING (white) : The current message is being sent.

SEND FAILED (amber) : Transmission of a request or a reply to an uplink message are unsuccessful.

SENT (white) : The current message was sent, but not necessarily received.

TIME

Indicated time corresponds to the time of:
- *Uplink message*, when the ATC center sent the message.
- *Downlink message*, when the flight crew transferred the message from the MCDU.

Ident.: DSC-46-10-40-20-10-00021245.0001001 / 17 MAR 17

BRT/DIM KEY

Adjusts the brightness of the DCDU

DESTINATION/ORIGIN ATC CENTER

Indicates the active ATC center that sent or received the message.

MESSAGE SCROLL KEY (MSG- / MSG+)

When pressed, displays the previous/next message in the file.

NEXT/PREVIOUS PAGE KEYS (PGE- / PGE+)

When pressed, displays the previous/next page of the message, if the message cannot be displayed on one single page.

PRINT KEY

Prints the message that is currently displayed on the DCDU.

Intentionally left blank

MCDU Datalink Pages

INTRODUCTION

Applicable to: MSN 04827-04974

Ident.: DSC-46-10-40-30-10-00021078.0002001 / 17 MAR 17

The MCDU MENU page enables access to datalink pages when the flight crew selects ATSU.

The ATSU of the MCDU MENU enables to access ATSU DATALINK page. The ATSU DATALINK page provides a subsequent access to:
- AOC MENU pages

  Note: *Due to the customization of AOC applications ◁ by each operator that is not monitored by Airbus, this Controls and Indicators chapter does not contain a description of controls and indicators associated with AOC applications.*

- ATC MENU pages
- COMM MENU pages
- DATALINK STATUS page
  Refer to DSC-46-10-40-30 DATALINK STATUS

Ident.: DSC-46-10-40-30-10-00021195.0001001 / 17 MAR 17

COMM CONFIG

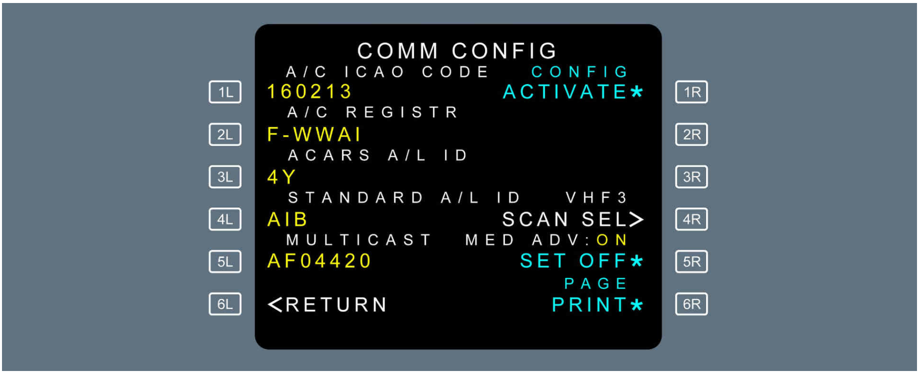
Ident.: DSC-46-10-40-30-00021253.0002001 / 17 MAR 17
Applicable to: MSN 04827-04974

EXAMPLE	This is an example of the COMM CONFIG page. Information, that are displayed on the COMM CONFIG page, depend on datalink customization, selected by each operator. E.g.: If a router configuration file, integrated in the ATSU, contains a customized VHF scan mask, the access to the VHF 3 SCAN SELECT page will not display. The VHF 3 SCAN SELECT page will not accessible.



```
      COMM CONFIG
 A/C ICAO CODE      CONFIG
160213           ACTIVATE*
 A/C REGISTR
F-WWAI
 ACARS A/L ID
4Y
 STANDARD A/L ID      VHF3
AIB              SCAN SEL>
 MULTICAST     MED ADV:ON

                      PAGE
<RETURN             PRINT*
```

EXAMPLE	[1L] A/C ICAO CODE	Displays the aircraft ICAO code. Note: *If the FMGC does not enter the parameter automatically, the flight crew can enter the A/C ICAO CODE manually.*
	[2L] A/C REGISTR	Displays the aircraft registration. Note: *If the FMGC does not enter the parameter automatically, the flight crew can enter the A/C REGISTR manually.*
	[3L] ACARS A/L ID	Displays the ACARS airline identification. Note: *If the FMGC does not enter the parameter automatically, the flight crew can enter the ACARS A/L ID manually.*
	[4L] STANDARD A/L ID	Displays the standard airline identification. Note: *If the FMGC does not enter the parameter automatically, the flight crew can enter the STANDARD A/L ID manually.*
	[5L] MULTICAST	Displays the optional multicast ACARS address.
	[6L] RETURN	When selected, the MCDU displays the COMM MENU page.
	[1R] CONFIG ACTIVATE	When selected, the system activates parameters that were entered manually.
	[5R] VHF3 SCAN SEL	When selected, the DCDU displays the VHF3 SCAN SELECT page.
	[5R] MED ADV	Sets the transition status of labels on/off.
	[6R] PAGE PRINT	When selected, the printer prints information.

REPLAY WITHIN XXS	Appears for 5 s, when the remaining time to answer is less than 30 s. XX represents the number of remaining seconds, before the message timer expires.
[2L]:	
PRESENT LEVEL	Inserts the present flight level in the message, in order to notify the ATC.
ASSIGNED LEVEL	Inserts the assigned flight level in the message, in order to read–back the assigned flight level.
CAN (AT)	Inserts CAN (AT), in order to accept the specified flight level (at the specified time).
CAN BLOCK LEVEL (AT)	Inserts CAN BLOCK LEVEL (AT), in order to accept the specified block flight level (at the specified time).
PREFERRED LEVEL	Inserts the preferred flight level, in order to notify the ATC.
TOP OF DESCENT	Inserts the preferred time to commence descent for approach, in order to notify the ATC.
[3L] CAN LEVEL NOW	Inserts CAN LEVEL NOW, in order to accept the specified flight level immediately.
[4L]:	
CANNOT	Inserts CANNOT, in order to refuse the specified flight level.
CANNOT BLOCK LEVEL	Inserts CANNOT BLOCK LEVEL, in order to refuse the specified block flight level.
[5L] PAGE CANCEL	When selected, the MCDU displays the EDIT page.

[6L] ATC MENU RETURN	When selected, the MCDU displays the ATC MENU page.
[6R] XFR TO DCDU	When selected, the DCDU displays prepared message.

 ATC MENU      MSG RECORD
<RETURN             PRINT
```

Lines 1 to 4	Display a summary of each recorded message: - Time - ATC center - Message status - Beginning of the message The latest recorded message is displayed at the top of the message record list. Pressing the left key, adjacent to each message title, displays full content of recorded message. *Note:* *Due to limitations of line length, the status of datalink messages is abbreviated:* - *"WILC" for WILCO* - *"UNBL" for UNABLE* - *"ABRT" for ABORT* - *"ROGR" for ROGER* - *"AFRM" for AFFIRM* - *"NEG" for NEGATIVE* - *"STBY" for STANDBY*
[5L] MSG RECORD ERASE	Clears all the recorded messages. When pressing MSG RECORD ERASE, MSG RECORD ERASE is replaced by ERASE MSG RECORD CONFIRM, in order to prevent an inadvertent erase.

[6L] ATC MENU RETURN	When selected, the MCDU displays the ATC MENU page.
[6R] MSG RECORD PRINT	When selected, the printer prints all recorded messages.

Note: *If sending a downlink message fails, the message appears in white on the MSG RECORD page.*

EXAMPLE

Indication of Flight Number Change

When the flight number changes, a specific message with the new flight number value is stored in the message record.

Line 3 : The specific message of the flight number change, indicating:
- New flight number
- Date of change.

NOTIFICATION

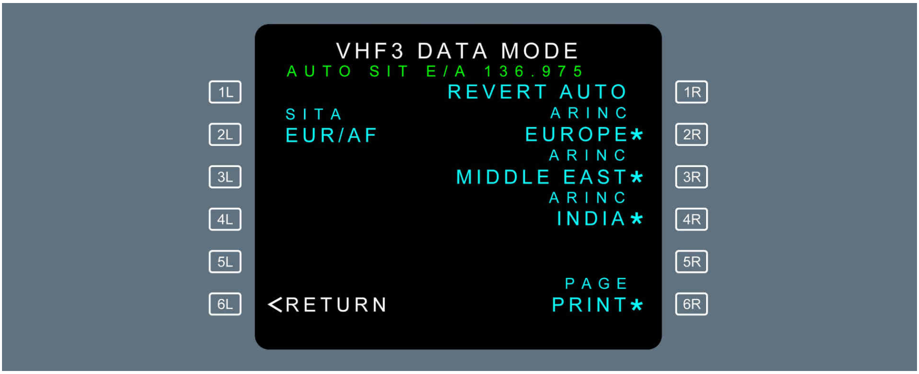
VHF3 DATA MODE

Ident.: DSC-46-10-40-30-00021252.0002001 / 17 MAR 17
Applicable to: MSN 04827-04974

EXAMPLE	This is an example of the VHF3 DATA MODE page. Information, that are displayed on the VHF3 DATA MODE page, depend on the service provider and datalink customization, selected by each operator. The VHF3 DATA MODE displays regions, and associated frequencies of datalink service providers that were selected.



```
         VHF3 DATA MODE
 AUTO SIT E/A 136.975
                   REVERT AUTO
 SITA                    ARINC
 EUR/AF                EUROPE*
                         ARINC
                  MIDDLE EAST*
                         ARINC
                        INDIA*

                          PAGE
<RETURN                 PRINT*
```

EXAMPLE	Line 1	Displays:
		- Mode of VHF provider selection:
		  - MANUAL
		The VHF3 is tuned to a frequency manually selected by the flight crew via the VHF3 DATA MODE page.
		  - AUTO
		The VHF3 is tuned to a frequency automatically selected by the ATSU.
		  - VOICE
		The VHF3 is in the voice mode.
		  - SCAN
		The VHF3 system scans for a data frequency.
		  - AUTO DATA INHIB
		No datalink service provider is available in the area.
		- Datalink service provider identification
		- The frequency of the service provide that the system is tuned to

	[2L] SITA EUR/AF	Displays the service provider (SITA Europe/Africa). In this example, the ATSU is connected to the provider SITA Europe/Africa (136.975 MHz).
	[6L] RETURN	When selected, the MCDU displays the COMM MENU page.
	[1R] REVERT AUTO	Reverts to VHF3 auto-tuning.
	[2R] ARINC EUROPE	When selected, the VHF3 tunes to the frequency of the ARINC EUROPE provider. The mode of VHF provider selection changes to MANUAL.
	[3R] ARINC MIDDLE EAST	When selected, the VHF3 tunes to the frequency of the ARINC MIDDLE EAST provider. The mode of VHF provider selection changes to MANUAL.
	[4R] ARINC INDIA	When selected, the VHF3 tunes to the frequency of the ARINC INDIA provider. The mode of VHF provider selection changes to MANUAL.
	[6R] PAGE PRINT	When selected, the printer prints information from the VHF3 DATA MODE page.

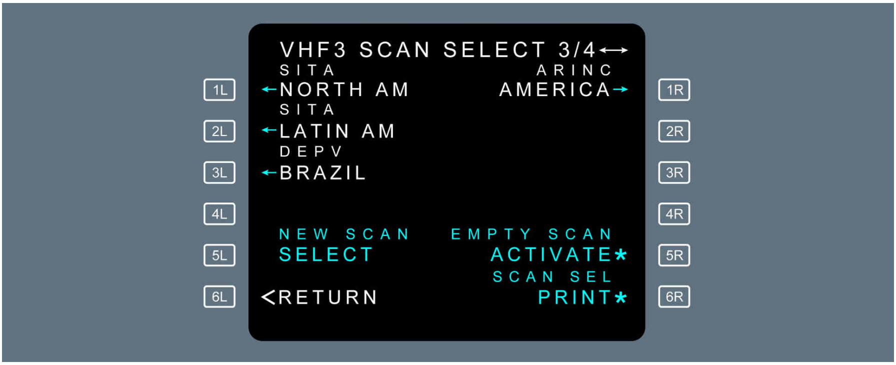
	[2R] ARINC ASIA	Selects the ARINC Asia (datalink service provider).
	[3R] ARINC AUSTRAL	Selects the ARINC Australia (datalink service provider).
	[4R] ARINC KOREA	Selects the ARINC Korea (datalink service provider).
	[5R] EMPTY SCAN ACTIVATE	Activates an emprty scan mask, in order to inhibit VHF datalink communication.
	[6R] SCAN SEL PRINT	When selected, the printer prints information.

THE VHF 3 SCAN SELECT PAGE 3/4



```
VHF3 SCAN SELECT 3/4←→
SITA                   ARINC
←NORTH AM            AMERICA→
SITA
←LATIN AM
DEPV
←BRAZIL

NEW SCAN          EMPTY SCAN
SELECT              ACTIVATE*
                     SCAN SEL
<RETURN                PRINT*
```

EXAMPLE	[1L] SITA NORTH AM	Selects the SITA North America (datalink service provider).
	[2L] SITA SOUTH AM	Selects the SITA South America (datalink service provider).
	[3L] DEPV BRASIL	Selects the DEPV Brasil (datalink service provider).
	[5L]: NEW SCAN SELECT : ACTIVE SEL DISPLAY :	 Selects the scan mask. Displays the scan mask used by ATSU.
	[6L] RETURN	When selected, the MCDU displays the COMM CONFIG page.
	[1R] ARINC AMERICA	Selects the ARINC America (datalink service provider).
	[5R] EMPTY SCAN ACTIVATE	Activates an emprty scan mask, in order to inhibit VHF datalink communication.
	[6R] SCAN SEL PRINT	When selected, the printer prints information.

THE VHF 3 SCAN SELECT PAGE 4/4

MCDU Scratchpad Messages

MCDU SCRATCHPAD MESSAGES

Ident.: DSC-46-10-40-40-10-00021084.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

MESSAGE	CONDITIONS
FORMAT: _ _ _	The acquisition format is not valid. An example of the required format is displayed (FORMAT: NNN, FORMAT : XXXX, etc), where: - N : Numerical data (0 to 9) - X : Alphanumerical data (0 to 9, or A to Z). To display the required format of specific data on the scratchpad message field, press on the corresponding empty field. This serves as a reference to the crew.
ENTRY OUT OF RANGE	The single value that was entered is out of range.
OUT OF RANGE	A single value of double data is out of range.
TWO ENTRIES OUT OF RANGE	The double value that was entered is out of range.
NON MODIFIABLE FIELD	A non-modifiable field was selected.
KEY NOT ACTIVE	It is not allowed to press this key.
ALREADY SELECTED	The selectable key has already been selected.
NOT ALLOWED	Data entry not allowed, or deselection of a selectable key not yet selected, or selection of a selectable key with any entry on the scratchpad other than CLR.
CLR NOT ALLOWED	An available key has been selected, but the function is not available due to CLR still displayed on the scratchpad field.
FLIGHT NBR UNAVAILABLE	Notification is not available, because the flight number is unavailable.
ENTER MANDATORY FIELDS	Selection of a command is not available, because mandatory fields are not filled in.
NO WHOLE MSG PREPARED	Selection of the ATC DISPL or ADD TEXT command is not available, because the message is not completely prepared.
COM UNAVAILABLE	The selected command is not available, because datalink comunications means are currently unavailable.
DCDU FILE FULL	The selected command is not available, because the DCDU file is full.

Continued on the following page

Continued from the previous page

MESSAGE	CONDITIONS
MSG ALREADY DISPLAYED	The XFR to DCDU command (FANS B / FANS B+), or the ATC DISPL command (FANS A+) is not available, because the message is already displayed on the DCDU.
NO MSG TO PRINT	The PRINT key was selected, but the function is currently unavailable because there is no message to be printed.
PRINTER UNAVAILABLE	The PRINT key was selected, but the printer is currently unavailable.
LAST MSG ELEMENT	Maximum number of message elements for a given downlink message is reached.
TOO MANY MSG ELEMENTS	Entry of a new parameter is not allowed, because the maximum number of message elements has been reached.
NO ACTIVE ATC	The XFR to DCDU key (FANS B / FANS B+) or ATC DISPL command (FANS A+) or MAX UPLINK DELAY command (FANS A+) was selected, but the function is currently unavailable because there is no active CPDLC connection.
LAT/LON DISPL ABREVIATED	The LAT/LONG display is abbreviated only on the MCDU display field, because there is lack of space.
MSG RECORD NOT RELIABLE	Due to a technical problem, the list of messages recorded is not reliable. All CPDLC messages are deleted and new messages should not be recorded.
MSG RECORD IS EMPTY	The MSG RECORD ERASE command is not available, because there are no messages recorded.
NOT IN DATABASE	Entry not in database.

SCRATCHPAD MESSAGES ON THE COMM MENU PAGE

MESSAGE	CONDITIONS
COMMAND NOT AVAIL	The command is not available.
DEFAULT VHF SP LIST *(1)*	The new SCAN MASK is not available. The system displays the default SCAN MASK instead.
ENTER A/C ICAO CODE	The aircraft ICAO code is not valid. To enter the A/C ICAO code, *Refer to DSC-46-10-50 How to Initialize*

Continued on the following page

Continued from the previous page

MESSAGE	CONDITIONS
ENTER A/C REGISTR or ENTER A/C REGISTER	The aircraft registration number is not valid. To enter this parameter, *Refer to DSC-46-10-50 How to Initialize*.
ENTER A/L ID or ENTER ACARS A/L ID or ENTER STANDARD A/L ID	The airline identification number is not valid. To enter this parameter, *Refer to DSC-46-10-50 How to Initialize*.
ENTER VHF 3 SCAN SELECT *(1)* or ENTER VHF 3 SCAN MASK *(1)*	No service provider has been selected.
FAILED COMMAND	The command, selected by the flight crew, cannot currently be performed.
FORMAT ERROR	The message was entered in an inappropriate format.
KEY NOT ACTIVE	The flight crew has pressed on MCDU a non allocated/non active key.
MULTICAST IGNORED	The multicast address is invalid (because equal to a/c ARN).
NOT ALLOWED	It is not permitted to press this key.
PRESS CONFIG ACTIVATE	Parameters of COMM MENU page have been modified. It is required to activate the new configuration.
PRINT FAILED	A print command is not successful.
PRT MSG PRINT FAIL	Automatic print of an AOC uplink message was not successful.
SYSTEM BUSY-TRY LATER	The system is busy. The command, selected by the flight crew, cannot currently be performed.
VHF 3 CAN BE SET IN VOICE	VHF 3 datalink communications are lost. However, VHF 3 can be used in voice mode.
VHF 3 SWITCH IMPOSSIBLE	It is not possible to switch from VHF 3 voice mode to VHF 3 data mode.

(1) *Depending on airline customization, access to the SCAN SELECT menu may not be possible. If it is not, the DEFAULT VHF SP LIST and ENTER VHF 3 SCAN SELECT/MASK scratchpad messages are not applicable.*

MCDU Data Entry Format

MCDU DATA ENTRY FORMAT

Applicable to: MSN 04827-04974

Ident.: DSC-46-10-40-50-10-00021085.0003001 / 21 MAR 17

This chapter lists the data that the flight crew can enter in the ATSU DATALINK pages of the MCDU.

For each type of data, the table displays:
- Acceptable format
- Units of entry
- Acceptable range
- Page(s) where the flight crew enters the data

The following characters are used to indicate the format:

A : Letters
N : Numeric (numbers)
X : Alphanumeric (letters and numbers).

DATA NAME	FORMAT	RANGE	UNIT	DISPLAY PAGE
A/C ICAO CODE	XXXXXXXX	8 characters		COMM CONFIG
A/C REGISTR	XXXXXXX	7 characters		COMM CONFIG
ACARS A/L ID	AA	2 letters		COMM CONFIG
ASSIGNED ALT	Same as ALT			EDIT
ATC CENTER	XXXXXXXX	4 to 8 characters		NOTIFICATION or FREQUENCY MONITORING
ATC NAME	AAAAAAAAAAAAAAAAAA	3 to 18 letters		FREQUENCY MONITORING
ATC FUNCTION	CTR/APP/TWR/FNL/GND/ CLR/DEP/CTL/RAD	3 letters		FREQUENCY MONITORING
DIR TO	XXXXX (Fixname)	Min 1 alphanumeric Max 5 alphanumeric		REQUEST
	DDMM.MB/ EEEMM.MC (LAT/LONG)	DD: 0-89 B: N or S	Degrees	
	"DD" = LAT degrees "EEE" = LONG degrees	MM.M: 0-59,9	Minutes	
	"MM.M" = LAT and LONG minutes Leading zeros may be omitted	EEE: 0-179 C: E or W	Degrees	

Continued on the following page

Continued from the previous page

DATA NAME	FORMAT	RANGE	UNIT	DISPLAY PAGE
FL/ALT	FLNNN or NNN Leading zeros on NNN may be omitted	30-410	Hundreds of feet (MSL)	REQUEST
	NNNNNFT or NNNNN Between 0 and 410 feet, “FT” must be written. Leading zeros may be omitted.	-600-41 000	Feet	
	NNNNNM or -NNNNNM or +NNNNNM Leading zeros may be omitted	-30-12 500	Meters

Ident.: DSC-46-10-40-60-A-00016906.0001001 / 21 MAR 16

1 COMPANY ALERT : This memo appears in green when the aircraft receives an uplink alert message, or when an AOC special condition requires a pilot action on the MCDU (depends on AOC programming). This memo pulses green for 180 s, then remains steady. It is associated with a buzzer for 1 s.

Ident.: DSC-46-10-40-60-A-00016904.0001001 / 21 MAR 16

2 COMPANY CALL : This memo appears in green when the aircraft receives a message from the ground requesting voice communication on VHF.

Ident.: DSC-46-10-40-60-A-00016903.0001001 / 21 MAR 16

3 COMPANY DATALINK STBY : This memo appears in green when AOC datalink air-ground communication is temporarily unavailable, but not lost.

Ident.: DSC-46-10-40-60-A-00016905.0001001 / 21 MAR 16

4 COMPANY MSG : This memo appears in green when the aircraft receives a message from the ground.

How To chapter contains examples of:
- How to initialize the datalink
- How to modify the flight plan.

Illustrations in How To are generic and do not reflect differences depending on the datalink standard installed in the aircraft.

INTRODUCTION

Ident.: DSC-46-10-50-00021191.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

How To chapter contains examples of:
- How to activate the datalink connection
- How to receive a datalink message
- How to create a datalink message
- How to send a datalink message.

Illustrations in How To are generic and do not reflect differences depending on the datalink standard installed in the aircraft.

HOW TO INITIALIZE

Ident.: DSC-46-10-50-00021142.0002001 / 17 MAR 17
2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 05005-05987, 06097, 06121, 06139-09324, 10949-11597**

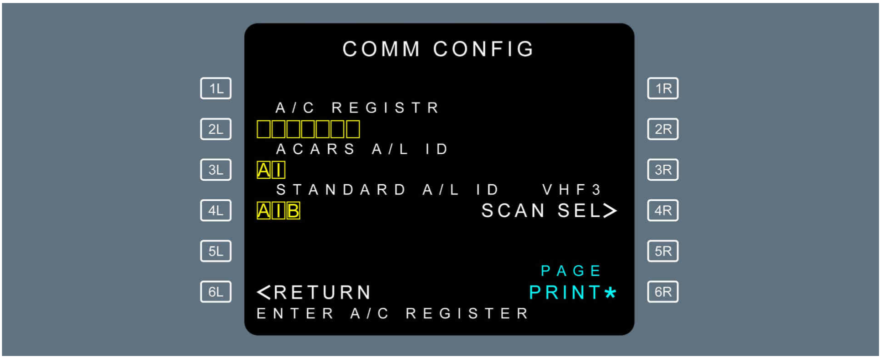
Datalink may be initialized:
- Automatically
  Datalink initializes automatically, provided that a list of service providers is scanned, and all required parameters are received, and validated by the ATSU.
- Manually
  Datalink may be initialized manually, when the system is not correctly initialized automatically.

The VHF3 SCAN SELECT page of the MCDU displays the list of service providers.
The COMM CONFIG / COMM INIT page, on the MCDU displays required parameters.

MANUAL INITIALIZATION

If one of required parameters is not valid, one or more manual entries may be required:

- **<u>If ARN is not valid</u>:**
  The MCDU scratchpad displays ENTER A/C REGISTER:



```
         COMM CONFIG

 A/C REGISTR
□□□□□□□
 ACARS A/L ID
AI
 STANDARD A/L ID    VHF3
AIB               SCAN SEL>

                      PAGE
<RETURN             PRINT*
ENTER A/C REGISTER
```

The flight crew clears the scratchpad, and inserts the A/C registration via the MCDU scratchpad.

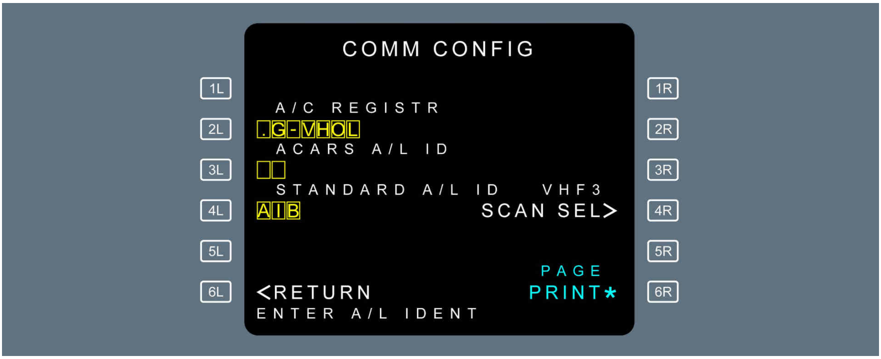
A/C REGISTR... INSERT

The flight crew inserts A/C ICAO registration via the MCDU scratchpad to A/C REGISTR.

CONFIG ACTIVATE...SELECT

The flight crew selects 1R/CONFIG ACTIVATE to activate manual entry of the A/C registration.

- **<u>If the A/L ID is not valid</u>:**
  The MCDU scratchpad displays ENTER A/L IDENT:



```
         COMM CONFIG

 A/C REGISTR
.G-VHOL
 ACARS A/L ID
□□
 STANDARD A/L ID    VHF3
AIB               SCAN SEL>

                      PAGE
<RETURN             PRINT*
ENTER A/L IDENT
```

The flight crew clears the scratchpad, and inserts the two-letter A/L ID code via the MCDU scratchpad.

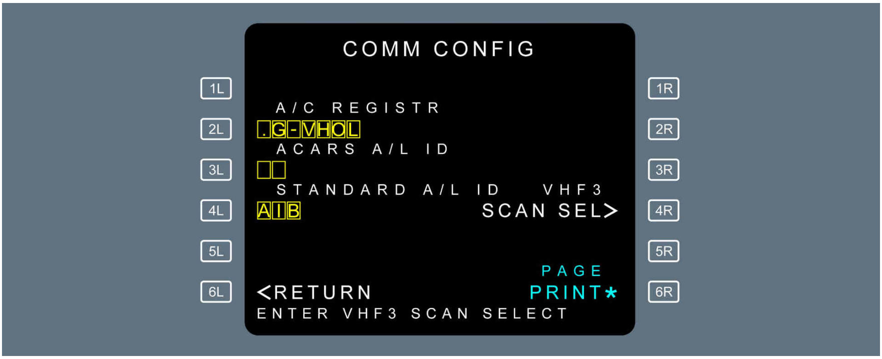
A/L ID.. INSERT

The flight crew inserts A/L ID code via the MCDU scratchpad to A/L ID.

CONFIG ACTIVATE.. SELECT

The flight crew selects 1R/CONFIG ACTIVATE to activate manual entry of the A/C registration.

- **<u>If VHF service provider is not selected</u>**
  and
  <u>if the VHF3 SCAN/MASK SELECT menu can be accessed:</u>
  The MCDU scratchpad displays ENTER VHF3 SCAN SELECT:

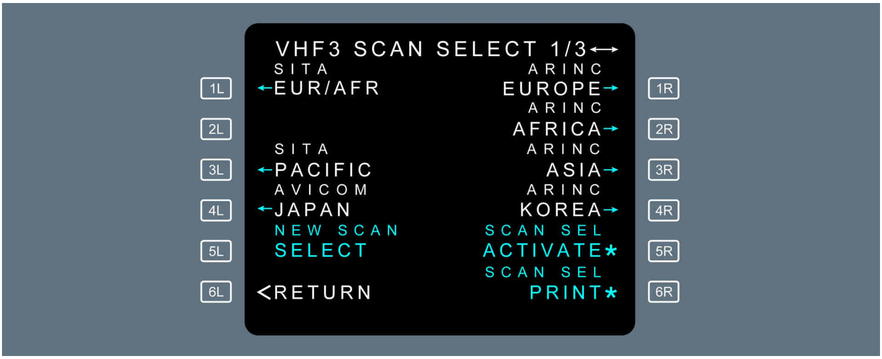


```
         COMM CONFIG

 A/C REGISTR
.G-VHOL
 ACARS A/L ID
□□
 STANDARD A/L ID     VHF3
AIB              SCAN SEL>

                      PAGE
<RETURN             PRINT*
ENTER VHF3 SCAN SELECT
```

On the VHF3 SCAN SELECT page, select service providers, in the airline priority order, and activate the VHF SCAN SELECT function.



```
 VHF3 SCAN SELECT 1/3←→
 SITA                ARINC
←EUR/AFR           EUROPE→
                     ARINC
                   AFRICA→
 SITA                ARINC
←PACIFIC             ASIA→
 AVICOM              ARINC
←JAPAN              KOREA→
 NEW SCAN         SCAN SEL
 SELECT          ACTIVATE*
                  SCAN SEL
<RETURN             PRINT*
```

EXAMPLE OF SELECTION OF DATALINK SERVICE PROVIDERS:

Selection of SITA 725 and ARINC service providers :

1. Press 5L key: The asterisk next to SELECT indication disappears, then reappears.
2. Press 1L key to select SITA 725: SELECT indication goes off, and the priority number of selection 1 appears.
3. Press 1R key to select ARINC: SELECT indication goes off, and the priority number of selection 2 appears.
4. Press 5R key to activate the VHF SCAN SELECT function: The star next to SCAN SELECT ACTIVATE indication disappears, then reappears.

Note: *Modification of the SCAN SELECT setting may result in the loss of air-ground VHF datalink communication, and the increase of datalink service provider charges. Therefore, the SCAN SELECT setting should not be modified by the flight crew, unless the flight crew is instructed to do so.*

HOW TO INITIALIZE

Ident.: DSC-46-10-50-00021142.0001001 / 17 MAR 17
Applicable to: MSN 04827-04974

Datalink may be initialized:

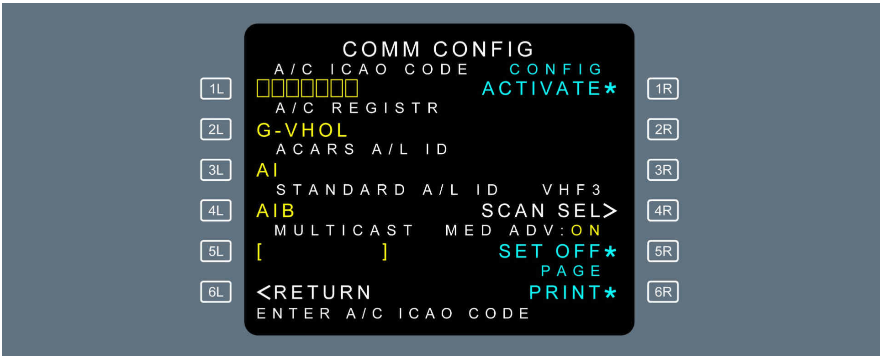
- Automatically
  Datalink initializes automatically, provided that a list of service providers is scanned, and all required parameters are received, and validated by the ATSU.
- Manually
  Datalink may be initialized manually, when the system is not correctly initialized automatically.

The VHF3 SCAN SELECT page of the MCDU displays the list of service providers.
The COMM COMFIG page, on the MCDU displays required parameters.

MANUAL INITIALIZATION

If one of required parameters is not valid, one or more manual entries may be required:

- **If the A/C ICAO CODE is not valid:**
  The MCDU scratchpad displays ENTER A/C ICAO CODE:



```
         COMM CONFIG
 A/C ICAO CODE     CONFIG
□□□□□□□□         ACTIVATE*
 A/C REGISTR
G-VHOL
 ACARS A/L ID
AI
 STANDARD A/L ID    VHF3
AIB               SCAN SEL>
 MULTICAST    MED ADV:ON
[        ]          SET OFF*
                       PAGE
<RETURN               PRINT*
ENTER A/C ICAO CODE
```

The flight crew clears the scratchpad, and inserts the A/C ICAO code (in hexal encoding) via the MCDU scratchpad.

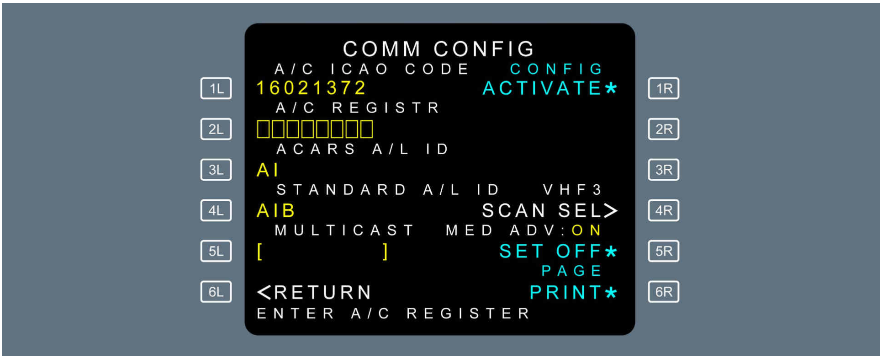
A/C ICAO CODE..INSERT

The flight crew inserts A/C ICAO code via the MCDU scratchpad into A/C ICAO CODE.

CONFIG ACTIVATE...SELECT

The flight crew selects 1R/CONFIG ACTIVATE to activate manual entry of the A/C ICAO code.

- **<u>If ARN is not valid</u>:**
  The MCDU scratchpad displays ENTER A/C REGISTER:



```
         COMM CONFIG
 A/C ICAO CODE     CONFIG
16021372         ACTIVATE*
 A/C REGISTR
□□□□□□□□□
 ACARS A/L ID
AI
 STANDARD A/L ID    VHF3
AIB               SCAN SEL>
 MULTICAST    MED ADV:ON
[        ]          SET OFF*
                       PAGE
<RETURN               PRINT*
ENTER A/C REGISTER
```

The flight crew clears the scratchpad, and inserts the A/C registration via the MCDU scratchpad.

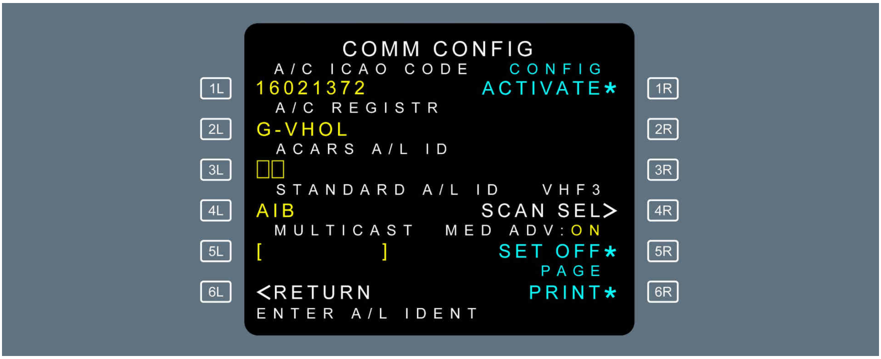
A/C REGISTR...INSERT

The flight crew inserts A/C ICAO registration via the MCDU scratchpad to A/C REGISTR.

CONFIG ACTIVATE..SELECT

The flight crew selects 1R/CONFIG ACTIVATE to activate manual entry of the A/C registration.

- **<u>If the A/L ID is not valid</u>:**
  The MCDU scratchpad displays ENTER A/L IDENT:



```
         COMM CONFIG
  A/C ICAO CODE      CONFIG
16021372          ACTIVATE*
  A/C REGISTR
G-VHOL
  ACARS A/L ID
□□
  STANDARD A/L ID       VHF3
AIB                SCAN SEL>
  MULTICAST     MED ADV:ON
[         ]         SET OFF*
                        PAGE
<RETURN               PRINT*
ENTER A/L IDENT
```

The flight crew clears the scratchpad, and inserts the two-letter A/L ID code via the MCDU scratchpad.

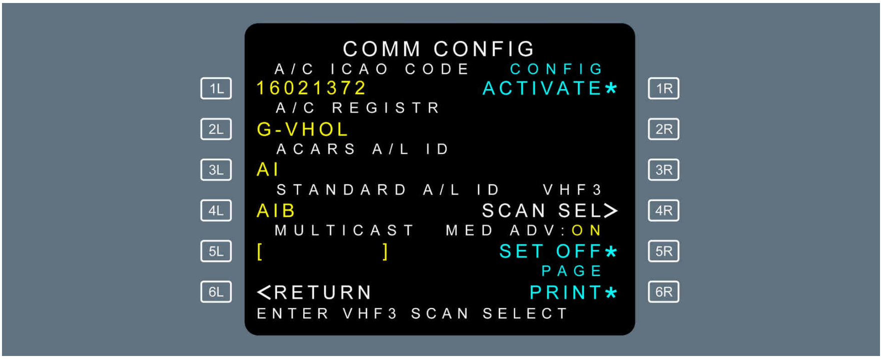
A/L ID..INSERT

The flight crew inserts A/L ID code via the MCDU scratchpad to A/L ID.

CONFIG ACTIVATE..SELECT

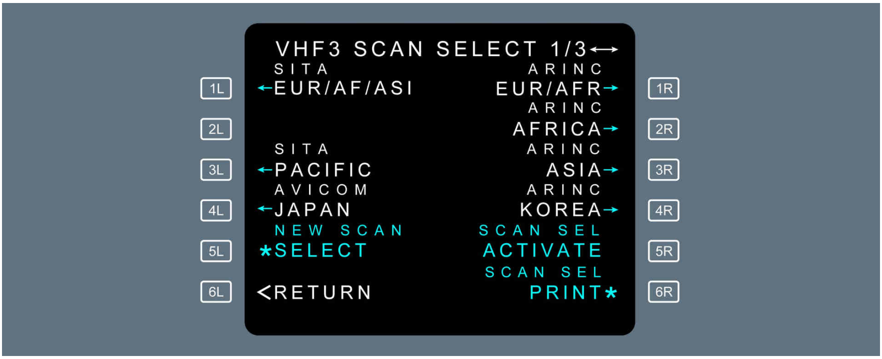
The flight crew selects 1R/CONFIG ACTIVATE to activate manual entry of the A/C registration.

- **<u>If VHF Service Provider is not selected</u>**
  and
  <u>if the VHF3 SCAN/MASK SELECT menu can be accessed</u>:
  The MCDU scratchpad displays ENTER VHF3 SCAN SELECT:



```
         COMM CONFIG
   A/C ICAO CODE      CONFIG
1L 16021372        ACTIVATE* 1R
   A/C REGISTR
2L G-VHOL                    2R
   ACARS A/L ID
3L AI                        3R
   STANDARD A/L ID    VHF3
4L AIB             SCAN SEL> 4R
   MULTICAST     MED ADV:ON
5L [         ]      SET OFF* 5R
                       PAGE
6L <RETURN            PRINT* 6R
ENTER VHF3 SCAN SELECT
```

On the VHF3 SCAN SELECT page, select service providers, in the airline priority order, and activate the VHF SCAN SELECT function.



```
     VHF3 SCAN SELECT 1/3←→
   SITA                ARINC
1L ←EUR/AF/ASI      EUR/AFR→ 1R
                       ARINC
2L                   AFRICA→ 2R
   SITA                ARINC
3L ←PACIFIC            ASIA→ 3R
   AVICOM              ARINC
4L ←JAPAN             KOREA→ 4R
   NEW SCAN         SCAN SEL
5L *SELECT          ACTIVATE 5R
                    SCAN SEL
6L <RETURN            PRINT* 6R
```

EXAMPLE OF SELECTION OF DATALINK SERVICE PROVIDERS:

Selection of SITA 725 and ARINC service providers :

1. Press 5L key: The asterisk next to SELECT indication disappears, then reappears.
2. Press 1L key to select SITA 725: SELECT indication goes off, and the priority number of selection # 1 appears.
3. Press 1R key to select ARINC: SELECT indication goes off, and the priority number of selection # 2 appears.
4. Press 5R key to activate the VHF SCAN SELECT function: The asterisk next to SCAN SELECT ACTIVATE indication disappears, then reappears.

Note: *Modification of the SCAN SELECT setting may result in the loss of air-ground VHF datalink communication, and the increase of datalink service provider charges. Therefore, the SCAN SELECT setting should not be modified by the flight crew, unless the flight crew is instructed to do so.*

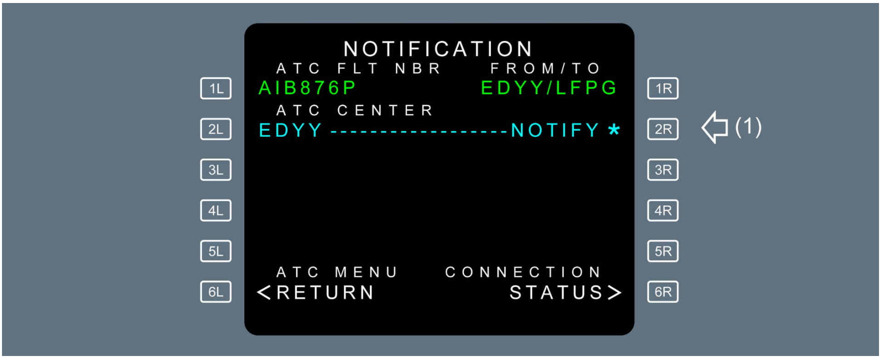
- **On the MCDU:**

  NOTIFICATION Page:

  NOTIFY .... SELECT See (1)

  The flight crew enters the ATC code via the MCDU scratchpad, if the FMS does not enter the ATC code automatically.



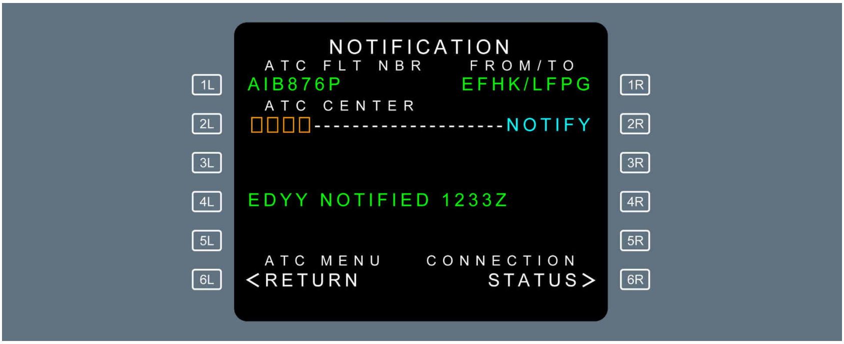
```
       NOTIFICATION
 ATC FLT NBR      FROM/TO
AIB876P         EDYY/LFPG
 ATC CENTER
EDYY -----------------NOTIFY *

 ATC MENU       CONNECTION
<RETURN             STATUS>
```

■ If the ATC center accepts the notification:

When ATC center accepts the notification, the MCDU displays the name of the notified ATC center:

ATC NOTIFIED on the MCDU



```
            NOTIFICATION
   ATC FLT NBR       FROM/TO
 AIB876P              EFHK/LFPG
   ATC CENTER
 □□□□------------------NOTIFY

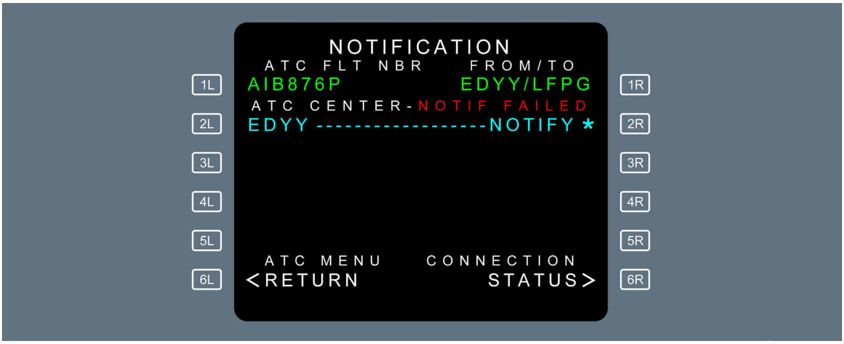
 EDYY NOTIFIED 1233Z

   ATC MENU        CONNECTION
 <RETURN               STATUS>
```

- **If the notification fails:**

If the notification fails, the MCDU displays NOTIF FAILED information:

NOTIF FAILED on the MCDU



```
            NOTIFICATION
   ATC FLT NBR       FROM/TO
 AIB876P              EDYY/LFPG
  ATC CENTER-NOTIF FAILED
 EDYY -----------------NOTIFY*

   ATC MENU        CONNECTION
 <RETURN               STATUS>
```

Note: *1. For ADS-C ◁ operations, check on the CONNECTION STATUS page, on the MCDU, that the ADS-C ◁ is set to ARMED before sending a notification.*
2. The notified ATC center initiates the CPDLC and/or ADS-C ◁ connection. Therefore, re-notifications should be avoided.
3. An automatic transfer from one ATC center to the next ATC center can be expected, if:

- *The MCDU displays the next ATC code, on the CONNECTION STATUS Page*
- *The DCDU displays NEXT ATC information with the desired ATC code, on the default screen, when no datalink message is displayed.*

HOW TO CONNECT

Applicable to: MSN 04827-04974

Ident.: DSC-46-10-50-10-00021239.0003001 / 17 MAR 17

CPDLC CONNECTION

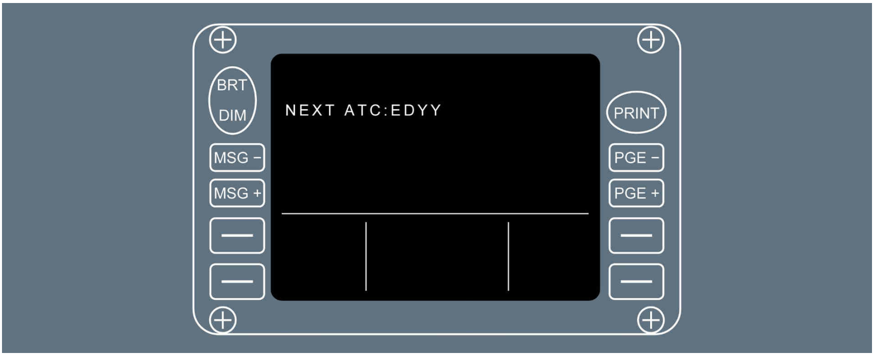
CONNECTION TO ACTIVE ATC

The ATC center initializes the CPDLC connection, when the ATC center receives a notification from the aircraft.
The DCDU displays the connected ATC (ACTIVE ATC), when the connection is established.
The MCDU displays the connected ATC (ACTIVE ATC) on the CONNECTION STATUS page.

NEXT ATC.. VERIFY

The flight crew should verify that the desired ATC center is connected.

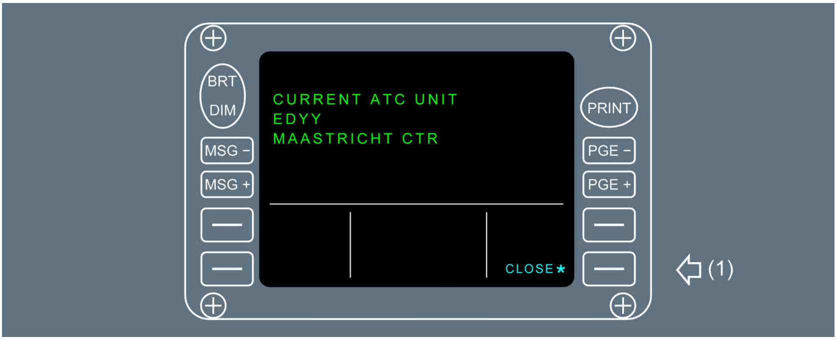
NEXT ATC on the DCDU



- **When the *CURRENT ATC* uplink message is received:**

CAUTION	The aircraft can be considered under the control of the active ATC center, when the flight crew receives a *CURRENT ATC* uplink message.

Note: *The transmission of the CURRENT ATC uplink message may take a few minutes.*



CURRENT ATC UNIT
EDYY
MAASTRICHT CTR

CLOSE*

CLOSE.. SELECT See (1)

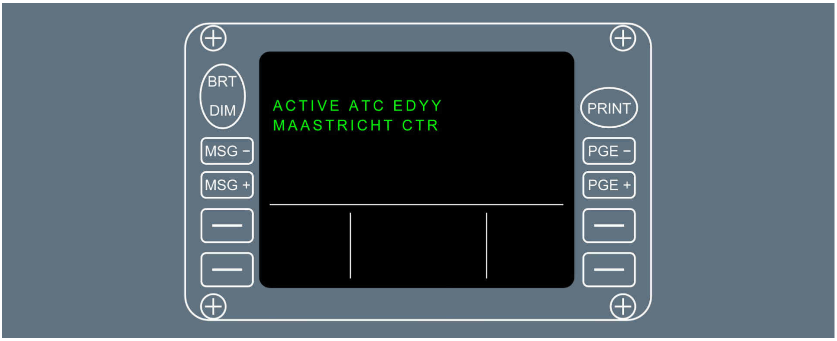
The flight crew must close the message.

ACTIVE ATC...VERIFY

The status of the connected ATC center, indicated as NEXT ATC (when the connection was initialized), changes to ACTIVE ATC.
The flight crew must verify that the desired ATC center is connected.

The aircraft is connected with the active ATC center (e.g. EDYY) and can exchange datalink messages.

ACTIVE ATC on the DCDU



ACTIVE ATC EDYY
MAASTRICHT CTR

CONNECTION TO NEXT ATC

The active ATC can transfer the datalink connection to a next ATC without requiring a flight crew action.

If the active ATC transfers the connection to the next ATC, the DCDU will automatically display the next ATC code in the NEXT ATC field, on the default screen, under the next ATC code in the NEXT ATC field.
When the flight crew receives a message of service termination from the active ATC, the next ATC becomes the active ATC.

HOW TO SEND REQUEST TO ATC

- The flight crew sends a new request (with the modified F-PLN) to the ATC.

Intentionally left blank

ATC MSG RECORD NOT RELIABLE - DISPLAYED AT ATSU POWER-UP

Ident.: DSC-46-10-60-00024038.0001001 / 28 MAY 20

1 **Applicable to: MSN 02734, 02924, 03032-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

DESCRIPTION

In some specific cases, such as ATSU power-up, the flight crew may experience the following:

- ATC MSG RECORD NOT RELIABLE DCDU message
- MSG RECORD NOT RELIABLE MCDU scratchpad message when the flight crew selects the MSG RECORD menu on the MCDU.

The flight crew may experience this abnormal behavior if, before the previous ATSU power-off, two CPDLC messages with the same time stamp were stored in the MSG RECORD.
At the next ATSU power-up, the MSG RECORD is emptied and the subsequent CPDLC messages are not stored in the MSG RECORD.

OPERATIONAL RECOMMENDATION

In such situation, the flight crew should perform a manual reset of the ATSU in order to recover the nominal ATSU behavior. *Refer to PRO-ABN-ABN-RESET System Reset Table - DATALINK*.

Intentionally left blank

INTRODUCTION

Ident.: DSC-46-20-20-00021223.0001001 / 04 JUN 19
Applicable to: ALL

The FlySmart with Airbus application suite is composed of:
- Takeoff application
- Landing application
- In-flight application
- Loadsheet application
- Operational Documentation application (OLB)
- Electronic QRH application (eQRH)
- Manager application (available for iPad version).

The FlySmart with Airbus application suite is designed to:
- Improve access to flight crew’s operational information
- Reduce the quantity of paper documents in the cockpit by replacing them with electronic documents
- Enable reduced revision and distribution cycles to ensure better technical data accuracy
- Ease and improve the operational data updating process
- Provide an accurate and optimized computation of performance.

The FlySmart with Airbus application suite can be used by the flight crew on a Portable Electronic Device (PED). The flight crew can use the power outlets ◁* (110 VAC / 60 Hz) installed on each lateral console to plug their PED.

Note: *The power outlets (115 VAC / 400 Hz) located on the rear of the cockpit are for maintenance use only.*

GENERAL

Ident.: DSC-46-20-20-00021224.0001001 / 20 MAR 17
Applicable to: ALL

The My Flight page enables:
- To check that FlySmart with Airbus applications are up to date. The My Flight page provides the version of the installed applications and data (EFB version)
- To start the Manager application, that enables to update the operational data (performance, manuals)
- To initialize the applications with the applicable aircraft tail number, flight number and citypair. This avoids multiple entries of the same data in the different applications.

There is one My Flight page per application. All the inputs that the user has entered on one My Flight page are retrieved by the other applications.

Note: *On the My Flight page of OLB application, the user can only enter the a/c type and a/c registration.*

LANDING APPLICATION

Ident.: DSC-46-20-20-00021225.0001001 / 20 MAR 17
Applicable to: ALL

The Landing application aims at computing the landing performance data (maximum landing weight, approach speed) according to the aircraft configuration and external conditions (runway, surrounding obstacles, weather).
The Landing application allows straightforward computations and provides the optimized landing performance for the given conditions.

TAKEOFF APPLICATION

Ident.: DSC-46-20-20-00021226.0001001 / 20 MAR 17
Applicable to: ALL

The Takeoff application aims at computing the takeoff performance data (maximum takeoff weight, takeoff speeds, flexible temperature) according to the aircraft configuration and external conditions (runway, surrounding obstacles, weather).
The Takeoff application allows straightforward computations and provides the optimized takeoff performance for the given conditions.

IN-FLIGHT APPLICATION

Ident.: DSC-46-20-20-00023257.0001001 / 04 JUN 19
Applicable to: ALL

The In-flight application aims at computing the in-flight performance data (time, fuel consumption, distance, altitude) according to the aircraft configuration and external conditions (weather).
The In-flight application allows straightforward computations and provides the optimized in-flight performance for the given conditions.

LOADSHEET APPLICATION

Ident.: DSC-46-20-20-00021227.0001001 / 20 MAR 17
Applicable to: ALL

The Loadsheet application allows the flight crew users to prepare the aircraft loading and to check that all weights and CG remain within the loading operational envelope. This eases the computation of the ZFWCG, ZFW, TOW and TOCG, and enables last–minute changes to the passenger/cargo/fuel distribution.

Depending on airline's authority requirements, the Loadsheet application can also generate a load and trim sheet.

OPS LIBRARY APPLICATION

Ident.: DSC-46-20-20-00021228.0001001 / 20 MAR 17
Applicable to: ALL

The OLB application enables the onboard consultation of any flight operations document published in the relevant format (e.g. airline's manuals), including the ones delivered by Airbus (FCOM, MEL, AFM, CDL, FCTM).
MEL and CDL items (including missing items) selected on OLB application are automatically transferred to Takeoff and Landing applications.

ELECTRONIC QRH APPLICATION

Ident.: DSC-46-20-20-00021515.0001001 / 04 JUN 19
Applicable to: ALL

The electronic QRH application (eQRH) is an application that enables the flight crew to:
- Manage the Normal Checklists and some Abnormal Procedures
- Access to some important operational data that may be required during the flight (such as the OEBs).

MANAGER APPLICATION

Ident.: DSC-46-20-20-00021229.0001001 / 20 MAR 17
Applicable to: ALL

The Manager application aims at updating on the iPad the operational data used by FlySmart with Airbus applications for iPad: performance data and operational manuals.

Intentionally left blank

GENERAL

Ident.: DSC-46-40-10-00017604.0001001 / 04 MAY 18
Applicable to: ALL

The aircraft is equipped with cabin connectivity systems which enable passengers to use:
- Mobile phones for voice and data services, and/or
- Internet wireless connection for access to the World Wide Web

The use of mobile phones is prohibited in cockpit and lavatories.
The following table provides the list of controls dedicated to Pax Entertainment & Connectivity Systems:

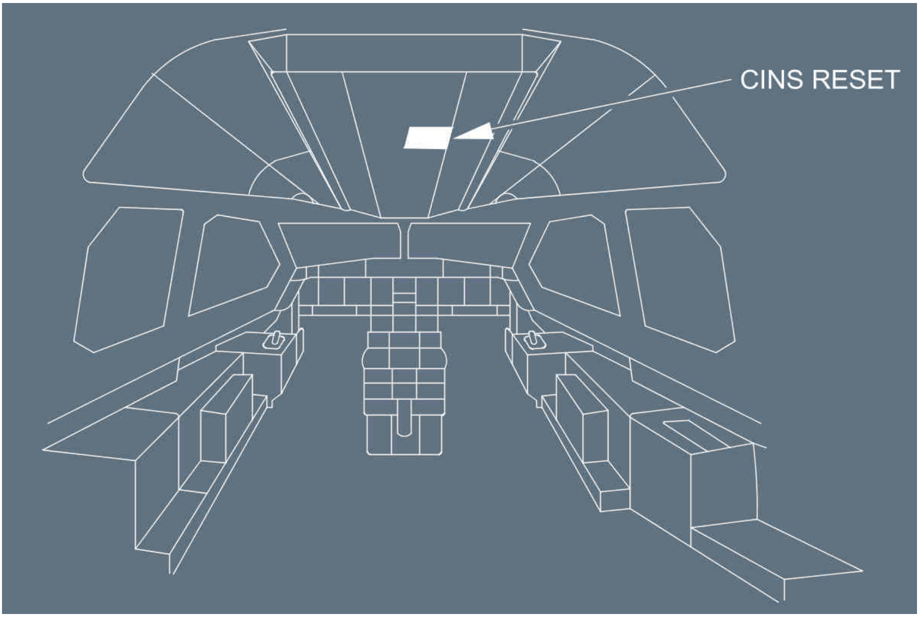
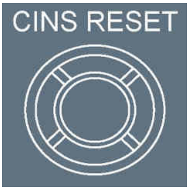
Note: *After the release of Mobile Com pushbutton, the DISC IN PROG light comes in blue and remains on until the total disconnection of the system.*

CINS RESET PB ⊲

Ident.: DSC-46-40-30-00017630.0001001 / 10 NOV 15
Applicable to: ALL



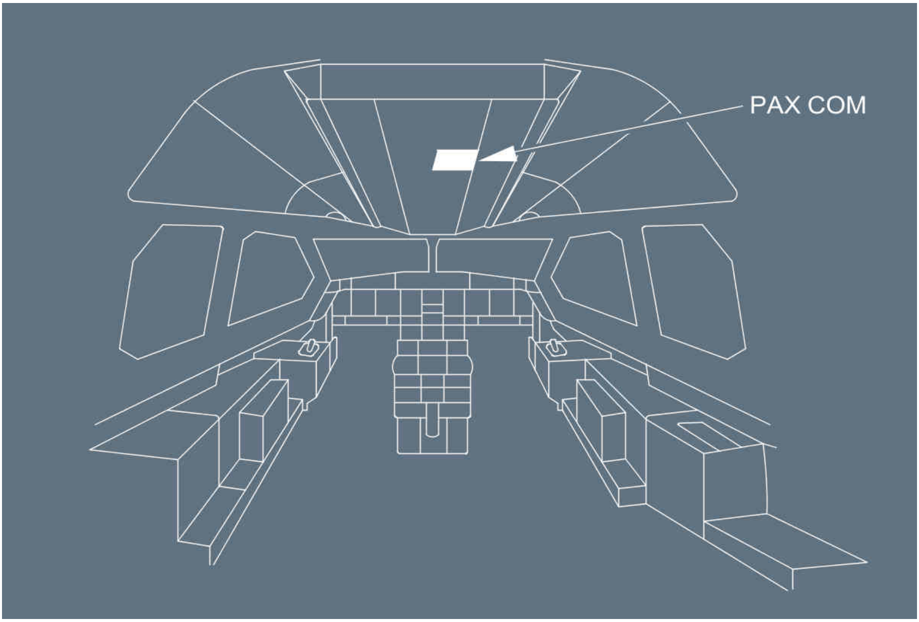
The pushbutton-switch described here below is installed on the 45 VU panel on the overhead panel.



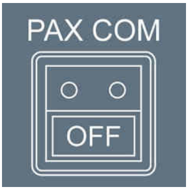
When pressed, it resets all Cabin Connectivity systems.

PAX COM PB-SW ⩤

Ident.: DSC-46-40-30-00021654.0001001 / 05 JUN 18
Applicable to: ALL



The pushbutton-switch described here below is installed on the overhead panel.

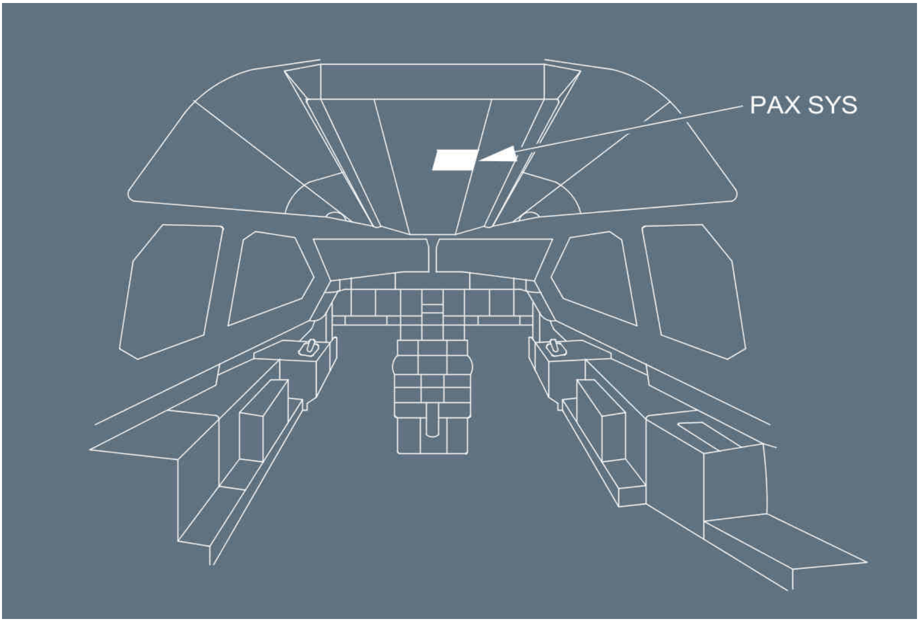


OFF : The Cabin Connectivity system is cut-off. When the pushbutton-switch is released, the OFF light comes on in white.

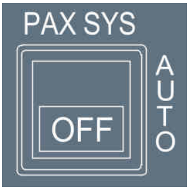
Note: *The location of the PAX COM PB-SW ⩤ on the overhead panel may differ (e.g. 45VU or 9020VU) depending on the aircraft configuration.*

PAX SYS PB-SW ◁

Ident.: DSC-46-40-30-00017735.0001001 / 05 JUN 18
Applicable to: ALL



The pushbutton-switch described here below is installed on the overhead panel.

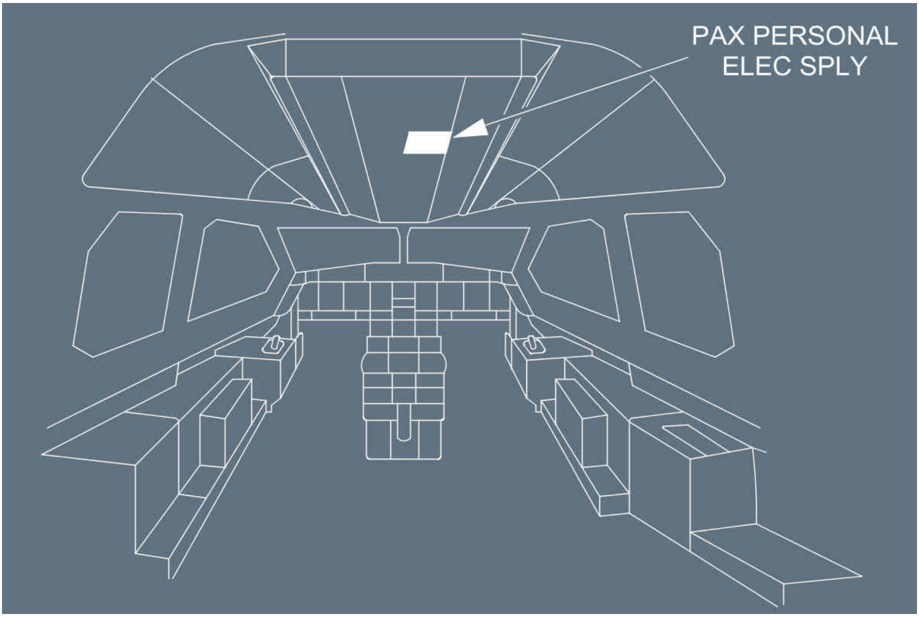


On or AUTO ◁ : All ISPSUs, In-Flight Entertainment (IFE) and Cabin Connectivity systems are powered.

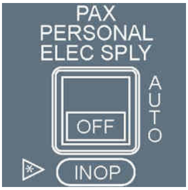
OFF : Simultaneously turns off all ISPSUs, In-Flight Entertainment (IFE) and Cabin Connectivity systems.

PAX PERSONAL ELEC SPLY PB-SW ◁

Ident.: DSC-46-40-30-00017629.0001001 / 04 MAY 18
Applicable to: ALL



The pushbutton-switch described here below is installed on the 56VU panel on the overhead panel.



AUTO ◁ : All ISPSUs are powered except in the following conditions:

- If the PED power switch located on the FAP is in the OFF position, or
- Takeoff, landing or decompression.

OFF : Turns off all ISPSUs.

INOP ◁ : This label indicates that the ISPSS has been deactivated and is inoperative.

MEMO DISPLAY

Ident.: DSC-46-40-30-00017628.0001001 / 05 MAY 22
Applicable to: ALL

GSM DISC < 4 MN	This memo appears, if the MOBILE COM pb-sw ◁* is pushed. It initiates a shutdown of the cabin connectivity systems within 4 minutes. This message is replaced by the NO MOBILE memo when the shutdown is completed.

GENERAL

Ident.: DSC-49-10-10-A-00017436.0001001 / 21 MAR 17
Applicable to: ALL

The Auxiliary Power Unit (APU) is a self-contained unit that supplies the aircraft with pneumatic and electrical power.

On the ground

- It supplies bleed air for starting the engines and for the air conditioning system
- It supplies electrical power to the electrical system.

During takeoff

- It supplies bleed air for air conditioning (for example, when optimum aircraft performance is required).

In flight

- It backs up the electrical system
- It backs up the air conditioning
- It can be used to start the engines.

The APU may obtain power for starting from the aircraft's batteries or normal electrical system, or from ground service.
APU starting is permitted throughout the normal flight envelope (*Refer to LIM-APU Operational Envelope*).

APU ENGINE

Ident.: DSC-49-10-20-00001528.0001001 / 21 MAR 16
Applicable to: ALL

The basic element of the APU is a single-shaft gas turbine that delivers mechanical shaft power for driving the accessory gearbox (electrical generator, starter, etc.) and produces bleed air (engine starting and pneumatic supply).

ELECTRONIC CONTROL BOX

Ident.: DSC-49-10-20-00001529.0001001 / 21 MAR 16
Applicable to: ALL

The Electronic Control Box (ECB) is a full-authority digital electronic controller that performs the bulk of the APU system logic for all modes of engine operation, such as :

- Sequences the start and monitors it.
- Monitors speed and temperature.
- Monitors bleed air.
- Sequences the shutdown.
- Controls the automatic shutdown.

AIR INTAKE SYSTEM

Ident.: DSC-49-10-20-00001530.0001001 / 21 MAR 16
Applicable to: ALL

The air intake and an electrically operated flap allow external air to reach the compressor inlet.

STARTER

Ident.: DSC-49-10-20-00001531.0001001 / 21 MAR 16
Applicable to: ALL

The ECB controls the electric starter. The starter engages if the air intake is fully open and the MASTER SW and the START pushbutton are ON.

FUEL SYSTEM

Ident.: DSC-49-10-20-00001532.0001001 / 21 MAR 16
Applicable to: ALL

The left fuel feed line supplies the APU.
The required pressure is normally available from tank pumps.
If pressure is not available (batteries only or pumps off) the APU FUEL PUMP starts automatically.
The ECB controls the fuel flow.

OIL SYSTEM

Ident.: DSC-49-10-20-00001533.0001001 / 21 MAR 16
Applicable to: ALL

The APU has an integral independent lubrication system (for lubrication and cooling).

INLET GUIDE VANES (IGV)

Ident.: DSC-49-10-20-00001534.0001001 / 21 MAR 16
Applicable to: ALL

The IGVs control bleed air flow, and a fuel-pressure-powered actuator positions the IGVs.
The ECB controls the actuator in response to aircraft demand.

AIR BLEED SYSTEM

Ident.: DSC-49-10-20-00001535.0002001 / 03 FEB 11
1 **Applicable to: MSN 06871-06876**

The air bleed system is fully automatic.
The APU speed is always 100 % whatever the air bleed system demand and the ground/flight configuration are.

AIR BLEED SYSTEM

Ident.: DSC-49-10-20-00001535.0003001 / 03 FEB 11
2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-06813, 06895-09324, 10949-11597**

The air bleed system is fully automatic.
The ECB always sets the APU speed to 100 % except for air conditioning demand, if the ambient temperature is between -18 °C and 35 °C. In this case, the ECB sets the APU speed to 99 %. For all other ambient temperatures (less than -18 °C or more than 35 °C), the ECB sets the APU speed to 100 %.

CONTROLS

Ident.: DSC-49-10-20-00001536.0001001 / 21 MAR 16
Applicable to: ALL

The flight crew uses the controls on the APU panel for routine shutdown. For emergency shutdown :
- the flight crew can push the APU FIRE handle, or
- the ground crew can push the APU SHUT OFF pushbutton on the interphone panel under the nose fuselage.

GROUND OPERATION SAFETY DEVICES

Ident.: DSC-49-10-20-00001537.0001001 / 21 MAR 16
Applicable to: ALL

The APU may run without cockpit crew supervision when the aircraft is on the ground. In case of fire in the APU compartment :

- APU fire warnings operate in the cockpit.
- A horn in the nose gear bay sounds.
- The AVAIL light goes out.
- The FAULT light in the MASTER SW lights up.
- The APU shuts down.
- The APU fire extinguisher discharges.

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-06813, 06895-09324, 10949-11597**

MASTER SW pb-sw

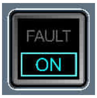
This switch controls the electric power supply for the operation of the APU and its protective features. It also controls the starting and shutdown sequences.

L12

- The APU is off, or
- The APU is in manual shutdown sequence

  Manual shutdown sequence:
  - The ON light on the MASTER SW pb-sw, and the AVAIL light on the START pb go out
  - If the aircraft was using APU bleed air, the APU keeps running for a cooling period of 60 to 120 s
  - At 7 % the air inlet flap closes.
- When pressed, initiates APU operation.

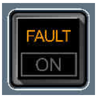
L12



- The APU is in operation, or
- The APU is in starting sequence

  Starting sequence:
  - Electric power goes to the APU system; the ECB performs a power-up test
  - The APU air intake flap opens
  - The APU fuel isolation valve opens
  - If no fuel tank pump is running, the APU fuel pump operates
  - If the aircraft has ground power or main generator power, the APU page appears on the ECAM display.
- When pressed, the APU shutdown sequence begins.

L12



Depending on version of the ECB:

- Indicates that an automatic APU shutdown occurs

  An automatic shutdown of the APU can happen in case of:
  - Fire (on ground only)
  - Air inlet flap closed
  - Overspeed
  - No acceleration
  - Slow start
  - EGT overtemperature
  - No flame
  - Reverse flow
  - Low oil pressure
  - High oil temperature
  - DC power lost (BAT OFF when aircraft on batteries only)
  - Overcurrent
  - Sensor failure
  - IGV failure
  - ECB failure
  - No speed
  - Underspeed
  - Loss of overspeed protection
  - Oil system shutdown
  - Inlet overheat
  - Clogged oil filter
  - Loss of EGT thermocouples.
- A caution appears on ECAM.

  Associated to the following ECAM alert:
  - APU AUTO (EMER) SHUT DOWN (*Refer to PRO-ABN-APU APU AUTO (EMER) SHUT DOWN - ANNUNCIATION*).

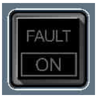
Ident.: DSC-49-20-A-00017685.0003001 / 28 MAY 20

2 **Applicable to: MSN 06871-06876**

MASTER SW pb-sw

This switch controls the electric power supply for the operation of the APU and its protective features. It also controls the starting and shutdown sequences.

L12

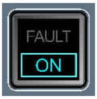


- The APU is off, or
- The APU is in manual shutdown sequence

Manual shutdown sequence:
- The ON light on the MASTER SW pb-sw, and the AVAIL light on the START pb go out
- If the aircraft was using APU bleed air, the APU keeps running for a cooling period of 60 to 120 s
- At 7 % the air inlet flap closes.

- When pressed, initiates APU operation.

L12

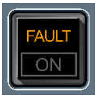


- The APU is in operation, or
- The APU is in starting sequence

Starting sequence:
- Electric power goes to the APU system; the ECB performs a power-up test
- The APU air intake flap opens
- The APU fuel isolation valve opens
- If no fuel tank pump is running, the APU fuel pump operates
- If the aircraft has ground power or main generator power, the APU page appears on the ECAM display.

- When pressed, the APU shutdown sequence begins.

L12



Depending on version of the ECB:

- Indicates that an automatic APU shutdown occurs

  An automatic shutdown of the APU can happen in case of:
  - Fire (on ground only)
  - Air inlet flap closed
  - Overspeed
  - No acceleration
  - Slow start
  - EGT overtemperature
  - No flame
  - Reverse flow
  - Low oil pressure
  - High oil temperature
  - DC power lost (BAT OFF when aircraft on batteries only)
  - Overcurrent
  - Sensor failure
  - IGV failure
  - ECB failure
  - No speed
  - Underspeed
  - Loss of overspeed protection
  - Oil system shutdown
  - Inlet overheat
  - Clogged oil filter
  - Loss of EGT thermocouples.

  Note: *In the case of an automatic, non-emergency shutdown, the air inlet flap closes 15 min after the APU speed is lower than 7%. If an automatic, non-emergency shutdown happens on ground, the 15 min countdown starts after liftoff.*

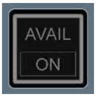
- A caution appears on ECAM.

  Associated to the following ECAM alert:
  - APU AUTO (EMER) SHUT DOWN (*Refer to PRO-ABN-APU APU AUTO (EMER) SHUT DOWN - ANNUNCIATION*).

Ident.: DSC-49-20-A-00017439.0002001 / 28 MAY 20

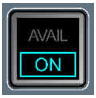
3 **Applicable to: MSN 06871-06876**

START pb-sw

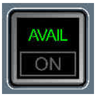


- The APU is off
- When pressed, starts the APU.

L12



- The APU start sequence is in progress
- When the APU reaches the appropriate speed, the ON light goes off and the AVAIL light comes on.
- Regarding the start sequence:
  - When the flap is completely open, the APU starter is energized
  - 1.5 s after the starter is energized, the ignition turns ON
  - When N = 55 %, the APU starter is de-energized, and the ignition turns OFF
  - 2 s after N reaches 95 %, or when N is above 99.5 %, the ON light on the START pb goes out
  - 10 s later, the APU page disappears from the ECAM display.



- The APU is started, and can supply bleed air and electrical power to the aircraft systems
- The AVAIL light comes on when N is above 99.5 % or 2 s after N reaches 95 %.

Ident.: DSC-49-20-A-00017439.0003001 / 28 MAY 20

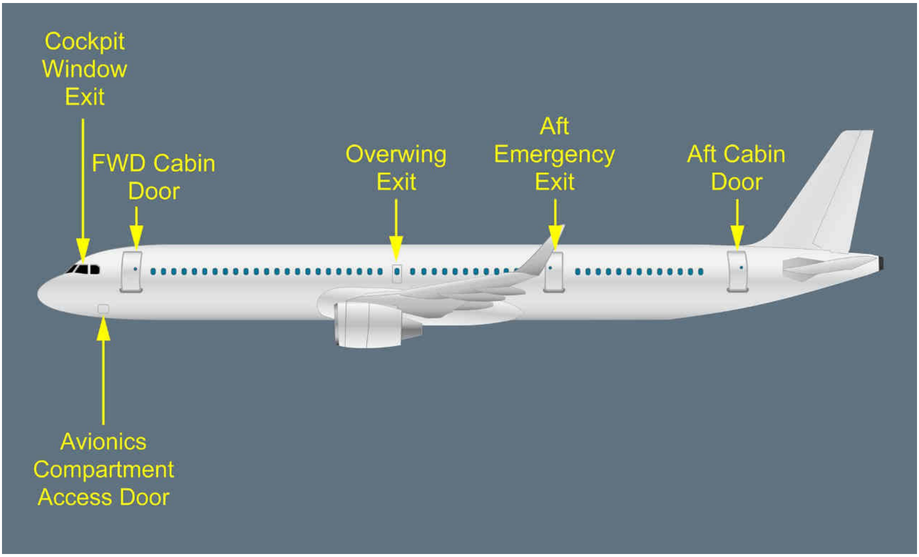
DESCRIPTION

1 Ident.: DSC-52-10-10-00001544.0023001 / 03 NOV 21

Applicable to: MSN 11531

The A321's fuselage has:
- Six cabin doors (two FWD, two aft emergency, two aft)
- Two cabin emergency overwing exits
- Two cockpit emergency exits (sliding windows)
- Three cargo compartment doors
- Four avionic compartment access doors.



Cockpit Window Exit
FWD Cabin Door
Overwing Exit
Aft Emergency Exit
Aft Cabin Door
Avionics Compartment Access Door

Note:
- *FWD cabin doors are called doors 1 on the FAP*
- *Overwing exits are called doors 2 on the FAP*
- *Aft emergency exits are called doors 3 on the FAP*
- *Aft cabin doors are called doors 4 on the FAP.*

GENERAL

Ident.: DSC-52-10-20-00017564.0001001 / 12 MAY 22
Applicable to: ALL

The aircraft has four plug-type doors that open outward and forward. There are two doors on each side of the fuselage (one door in the FWD section and one door in the AFT section).
The doors are operated from inside or outside of the aircraft. Normal operation is manual, with hydraulic damping.

Each door has emergency features:
- A slide stowed in a container attached to the inboard lower side of the door
- A damper actuator. In normal mode, the damper actuator limits the door travel. In emergency mode, the damper actuator drives the automatic door opening
- A slide arming lever.

Note: *The aircraft can be equipped with either escape slide or slide raft.*

When the slide arming lever is in the ARMED position, the slide is connected to the floor brackets on both sides of the door. When the door is opened, the slide inflates and deploys automatically. If the inflation bottle fails to discharge automatically, a crew member can open its valve to make it discharge. Opening the door from outside disarms the door and the slide.

Each passenger door has :
- A mechanical locking indicator that confirms the locked or unlocked position of the door
- One warning light to show the ARMED or DISARMED indication of the slides
- One CABIN PRESSURE warning light that illuminates in the case of a residual pressure in the cabin.

The slides of the overwing exits are always in armed configuration.

To open an overwing exit:

- Remove and discard the HANDLE COVER via the COVER RECESS
- Fully pull down and release the CONTROL HANDLE

Each overwing exit is equipped with an electrical flight lock actuator that locks the overwing exit handle, in order to prevent inadvertent operation during flight.
All flight lock actuators engage during the takeoff roll.

All flight lock actuators disengage:
- During the landing roll, or
- In the case of a rejected takeoff, or
- In the case of a loss of DC BUS 1.

GENERAL

Ident.: DSC-52-10-40-00017569.0001001 / 21 MAR 16
Applicable to: ALL

The aircraft has two cargo doors (FWD and AFT cargo doors) on the right side of the fuselage below the cabin floor.

FWD AND AFT CARGO DOORS

Ident.: DSC-52-10-40-00017570.0001001 / 21 MAR 16
Applicable to: ALL

The FWD and AFT cargo doors hydraulically open outward and upward. The doors are hydraulically operated by the yellow hydraulic system. The door locking system (locked open/locked closed) is mechanical.
If the electric pump of the yellow hydraulic system fails, the system can be powered by using a hand pump, located on the hydraulic maintenance panel.
The FWD and AFT cargo doors open only from outside.

Note: *When the electric pump operates the FWD or AFT cargo door, the remaining yellow system devices that operate are the brakes and the engine 2 thrust reverser.*

BULK CARGO DOOR ◁

Ident.: DSC-52-10-40-00017571.0001001 / 21 MAR 16
Applicable to: ALL

The bulk cargo door opens inward and upward. The bulk cargo door is a plug-type door. The door is mechanically locked and manually operated.
The bulk cargo door opens from the outside or from the inside.

Applicable to: MSN 01143-01251, 01518, 01593-01628

A forward-opening hinged door separates the cockpit from the passenger compartment. In the case of an emergency, the cockpit door can be forced open in either direction.

The cockpit door has:
- An electric locking latch ◁ controlled by the DOOR UNLOCK pb on the pedestal
- An eye-level viewing lens.

To unlock the door, the pilot must press the DOOR UNLOCK pb, and maintain it pressed, while the cabin attendant pushes the cockpit door open.

COCKPIT DOOR DESCRIPTION

Ident.: DSC-52-40-10-00017010.0001001 / 17 MAR 17

1 **Applicable to: MSN 01376-01459, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

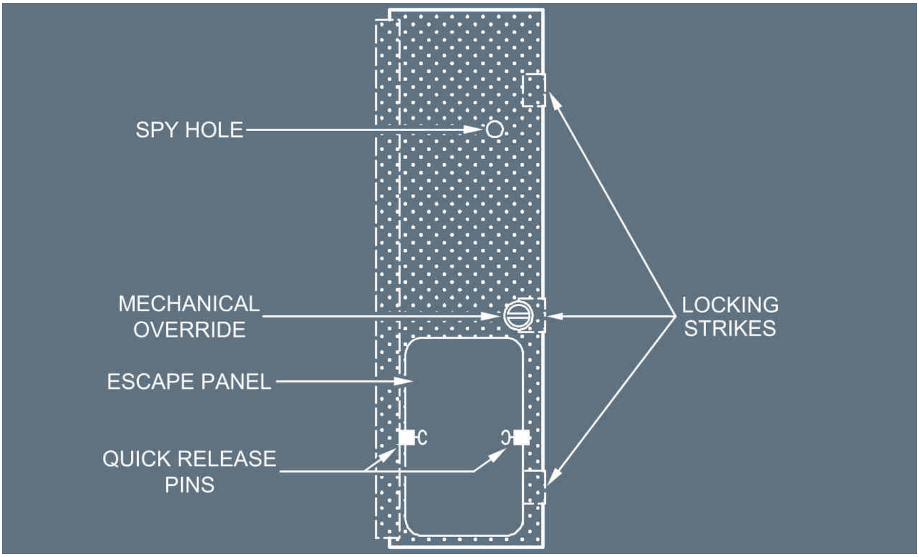
A forward-opening hinge door separates the cockpit from the passenger compartment. It has three electric locking strikes, controlled by the flight crew. In normal conditions, when the door is closed, they remain locked. When there is a request to enter the cockpit, the flight crew can authorize entry by unlocking the door, that remains closed until it is pushed open.

When the flight crew does not respond to requests for entry, the door can also be unlocked by the cabin crew, by entering a two to seven-digit code (programmed by the airline) on the keypad, installed on the lateral side of the Forward Attendant Panel (FAP).

The door is bulletproof and fully compliant with rapid decompression requirements.

A mechanical override enables the flight crew to open the door from the cockpit side.

A deadbolt ◁ is installed at the level of the center latch area of the cockpit door. This deadbolt bolts the door from the cockpit side, in the event that more than one locking latch strike fails, or in the case of a total CLS failure.



Note: 1. *The escape panel enables the flight crew to evacuate the cockpit, in case of an emergency, when the door is jammed. This panel can only be removed from the cockpit side by pulling the quick release pins towards the center of the flap and kicking the panel open.*
2. *In case of an electrical supply failure, the door is automatically unlocked, but remains closed.*

COCKPIT DOOR LOCKING SYSTEM (CDLS)

Ident.: DSC-52-40-20-00001007.0001001 / 21 MAR 17

1 **Applicable to: MSN 01376-01459, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The Cockpit Door Locking System (CDLS) provides a means of electrically locking and unlocking the cockpit door. This system is mainly composed of :
- A keypad, located in the forward cabin, near the cockpit door,
- A toggle switch, located in the center pedestal's Cockpit Door panel,
- A control unit and its CKPT DOOR CONT normal panel, located on the overhead panel,
- A buzzer.

The keypad enables the cabin crew to request access to the cockpit. There are two different access request types : “Routine” and “Emergency” access request.
The toggle switch enables the flight crew to lock or unlock the cockpit door, following an access request, thereby allowing or denying the entry to the cockpit.

The cockpit door control unit is the system controller, in charge of :
- Locking or unlocking the door latches, upon flight crew action.
- Unlocking the door, in case of cockpit decompression (the door then opens towards the cockpit under differential pressure).
- Indicating system failures of electrical latches and pressure sensors.
- Activating the access request buzzer and turning on the keypad LEDs.

The buzzer sounds in the cockpit for 1 to 9 s to indicate that a routine access request has been made, or sounds continuously if an emergency access procedure has been initiated.

CONTROLS

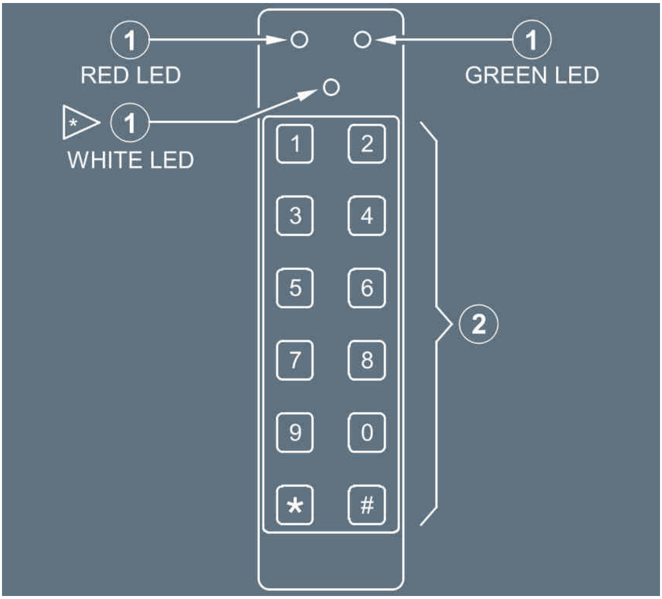
Applicable to: MSN 01376-01459, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: DSC-52-40-20-A-00001008.0001001 / 21 MAR 17

2

KEYPAD

The keypad is used by the cabin crew to request pilots to open the door.



(1) Locked/Unlocked Door Indicator

GREEN light ON	:	The door has been unlocked either by a flight crew action, or automatically (during 5 s) when no flight crew action is performed during the delay following an emergency access request. The door can be pushed open.
GREEN light flashes	:	An emergency request to enter the cockpit has been made; the buzzer will sound continuously in the cockpit, but no action has yet been taken by the flight crew.
RED light ON	:	The flight crew has denied access, and the door remains locked.
WHITE light ON ◁*	:	The light comes on each time the cabin crew presses a key on the keypad.

(2) Digital Keypad
The keypad is used to sound the buzzer in the cockpit for 1 to 9 s (3 s by default), by entering a zero to seven-digit code, as programmed by the airline, followed by the '#' key.
It is also used to enter the two to seven-digit emergency code, followed by the '#' key, when the flight crew does not respond.

Note: *During the test performed by the cockpit door control unit, the CDLS keypad remains operational, and the CDLS operates as follows:*
The control unit will store access codes that are entered, and the LOCKED/UNLOCKED DOOR INDICATOR (RED/GREEN LEDs) of the keypad will remain on, as long as the test is running.

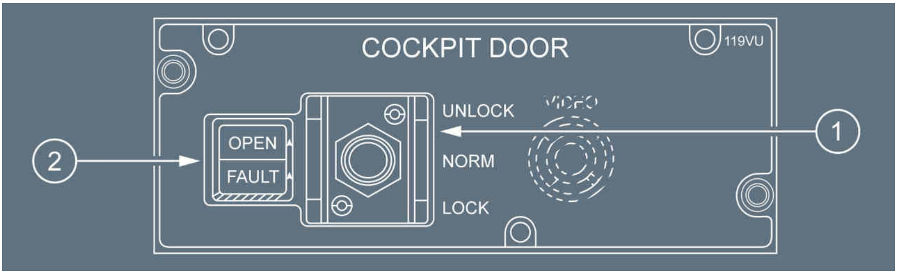
- *If the correct access code is entered on the keypad, the buzzer will not sound, until the test is completed.*
- *If the emergency access code is entered, the door will unlock. The cockpit buzzer and the LOCKED/UNLOCKED DOOR INDICATOR will be inoperative.*

Ident.: DSC-52-40-20-A-00018437.0001001 / 17 MAR 17

3

CENTRAL PEDESTAL COCKPIT DOOR PANEL

The secured cockpit door opening is controlled by a toggle switch, located on the central pedestal.



(1) COCKPIT DOOR toggle switch

UNLOCK position	:	This position is used to enable the cabin crewmember to open the door. The switch must be pulled and maintained in the unlock position until the door is pushed open.
NORM position	:	All latches are locked, and EMERGENCY access is possible for the cabin crew.
LOCK position	:	Once the button has been moved to this position, the door is locked ; emergency access, the buzzer, and the keypad are inhibited for a preselected time (5 to 20 min).

Note: 1. *If the LOCK position has not been used by the pilot, for at least 5 to 20 min, the cabin crew is able to request emergency access to open the cockpit door.*
2. *The UNLOCK position overrides and resets any previous selection.*
3. *In case of an electrical supply failure, the cockpit door is automatically unlocked, but remains closed.*

(2) COCKPIT DOOR Fault Open indicator

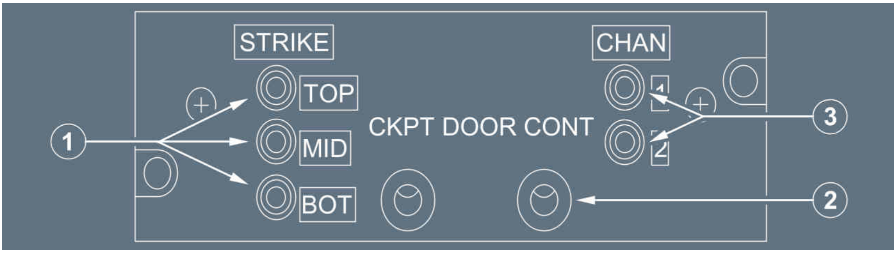
OPEN light ON	:	The door is not closed.
OPEN light flashes	:	The cabin crew has started an emergency access procedure. If there is no reaction from the flight crew, the door will unlock at the end of the adjustable time delay (15 to 120 s).
FAULT	:	This light comes on when a system failure has been identified (Example : Latch, pressure sensors, control unit). The inoperative item can be identified by checking the strike and pressure sensor status lights on the CKPT DOOR CONT panel.

Ident.: DSC-52-40-20-A-00001010.0001001 / 09 OCT 12

4

OVERHEAD CONTROL PANEL

The Cockpit Door Locking System's control panel is located on the overhead panel.



(1) Strikes' status lights

Off : The corresponding (upper, mid, or lower) locking latch is operative.

On : The corresponding (upper, mid, or lower) locking latch is faulty.

(2) Pressure sensor

Two redundant differential pressure sensors enable rapid pressure variation in the cockpit to be detected, in order to command simultaneous opening of all latches when a defined pressure drop is detected.

(3) Pressure sensor status lights

Off : The corresponding (1 or 2) pressure sensor is operative.

On : The corresponding (1 or 2) pressure sensor is faulty.

Note: *These indicators enable the crew to identify the faulty item, when the Central Pedestal Fault indicator light is ON.*

Intentionally left blank

(1) Cockpit Door Video pb
Selects the various camera image displays.

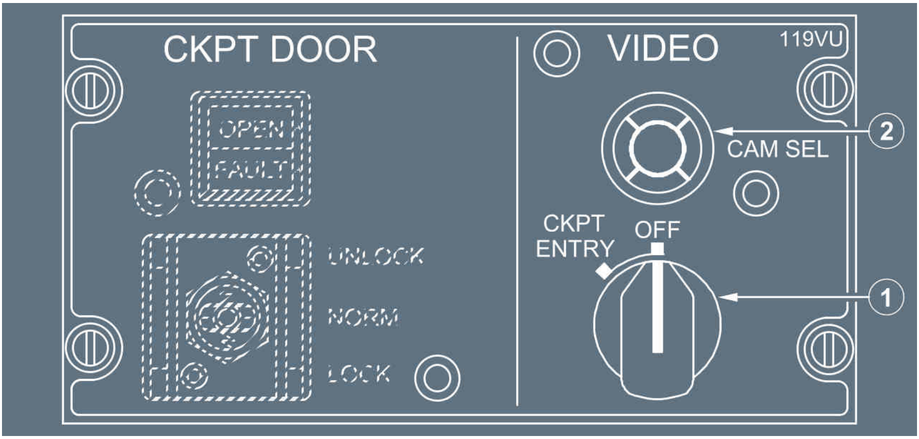
Camera 1 image	:	Displayed by pressing the pushbutton when the screen is on standby, or after Camera 2 and 3 images have been displayed. Automatically displayed, after an entry request is performed on the keypad.

Camera 2 and 3 images	:	Displayed on a split screen, when the pushbutton is pressed after Camera 1's image has been displayed.
Standby	:	If the pushbutton is maintained pressed for at least two seconds, or if no action has been taken for 5 min, the screen goes blank and remains on standby.

Note: *An entry request, performed on the keypad within 30 s following an earlier entry request, will not lead to the automatic selection of Camera 1, since the flight crew is given authority to select any desired camera image via the cockpit door video pb. After these 30 s, the system reverts to its normal operation.*

Ident.: DSC-52-40-30-A-00018416.0003001 / 17 MAR 17

4 **Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 11531**



(1) Lower ECAM rotary selector

CKPT ENTRY	:	The lower ECAM displays the camera 1 image. The camera images are not displayed on the Lower ECAM display in the case of: - A subsequent automatic system page call following a warning, a caution, or an advisory, or - A subsequent manual selection of a system page on the ECAM Control Panel (ECP), or - A SD failure, or - An EWD failure.
OFF	:	The lower ECAM display operates normally.

(2) Lower ECAM CAM SEL

Selects various camera image displays, when the lower ECAM rotary selector is set to the CKPT ENTRY position.

The image from camera 1 appears:

- Automatically, when the lower ECAM rotary selector is set to the CKPT ENTRY position.
- When images from cameras 2 and 3 are displayed, and after the flight crew presses the lower ECAM CAM SEL pb
- Automatically, when images from cameras 2 and 3 are displayed, and after a crew member uses the cabin keypad to make an entry request at least 30 s after a previous entry request.

Images from cameras 2 and 3 are displayed simultaneously on a split screen, when the image from camera 1 is displayed, and after the flight crew presses the lower ECAM CAM SEL pb.

Note: *1. The message "PLEASE WAIT" is displayed during the transition between two video images when the flight crew requests an image change.*
2. The message "VIDEO NOT AVAIL" is displayed when the flight crew requests a video image and no image can be displayed.

HOW TO OPERATE THE COCKPIT DOOR

Ident.: DSC-52-50-00020495.0001001 / 17 MAR 17
Applicable to: ALL

The secured cockpit door operation is controlled by a toggle sw that is located on the COCKPIT DOOR panel (central pedestal).

DOOR OPENING FROM THE COCKPIT

To enable access to the cockpit, set and maintain the COCKPIT DOOR sw to the UNLOCK position until the door is fully opened. When the door is fully opened, the COCKPIT DOOR sw can be released to the NORM position.

DOOR CLOSING FROM THE COCKPIT

Close the door and check that the OPEN indicator goes off. If the COCKPIT DOOR sw is in the NORM position, the door is locked and emergency access is possible from the cabin. When the door is fully closed, if the cockpit door FAULT light is ON, *Refer to PRO-ABN-DOOR [QRH] COCKPIT DOOR FAULT*.

Note: *If the OPEN indicator is ON when the door is closed, the door may be unlocked. Repeat the above-mentioned opening/closing procedure.*

When the COCKPIT DOOR sw is in the LOCK position the door is locked. In this position, the emergency access, the buzzer, and the keypad are inhibited for a preselected time (5 to 20 min).

ROUTINE ACCESS TO THE COCKPIT FROM THE CABIN (I.E. NORMAL ACCESS)

To request access to the cockpit from the cabin, use the keypad to enter the code and validate with the “#” key.

L2 The Operator defines this code (between 0 and 7 digits).

L1 The buzzer sounds in the cockpit for 1 to 9 s (3 s by default).
After identification of the person (using the Cockpit Door Surveillance System ◁) that requests access, set the COCKPIT DOOR sw to UNLOCK position to unlock the door. A steady green light on the keypad comes on, that indicates that the door is unlocked.
If the flight crew refuses access to the cockpit by setting the COCKPIT DOOR sw to LOCK position, a steady red light on the keypad comes on, that indicates that the door is locked. The keypad and the buzzer are inhibited for a defined period of time.
If the flight crew does not respond, the door remains locked. If the flight crew does not take any action after a routine cabin request, the cabin crew will be able to open the door with the emergency access procedure.

EMERGENCY ACCESS FROM CABIN TO THE COCKPIT

To request emergency access to the cockpit, use the keypad to enter the emergency code and validate with the “#” key.

L2 The Operator defines this emergency code (between 2 and 7 digits).

L1 The buzzer continuously sounds in the cockpit and the OPEN light flashes on the COCKPIT DOOR panel (central pedestal). In the cabin, the green light on the keypad flashes until the flight crew uses the COCKPIT DOOR sw to either lock or unlock the cockpit door.
After identification of the person (via the Cockpit Door Surveillance system ◁) that requests access, use the COCKPIT DOOR sw to unlock the door.
If the flight crew refuses access by setting the COCKPIT DOOR sw to LOCK position, the keypad and the buzzer are inhibited for a defined period of time.
If the flight crew does not respond, after a preselected time between 15 and 120 s, the door automatically unlocks for 5 s and a steady green light on the keypad comes. The buzzer stops and indicates that the door is unlocked.

EVACUATION THROUGH THE DECOMPRESSION AND EVACUATION PANEL

Pull the quick-release pins of the escape panel towards the center of the flap.
Kick the escape panel toward the cabin and evacuate the cockpit.

HOW TO OPERATE THE FWD AND AFT CARGO DOOR

Ident.: DSC-52-50-00020574.0003001 / 17 MAR 17
Applicable to: ALL

NORMAL OPERATION

OPENING

On the cargo door, push the door handle flap inward to release the door handle from the recess of the door structure. Then, pull the door handle away and upward from the LOCKED to the UNLOCKED position.
Open the access door of the service panel to get access to the selector valve lever. Set the selector valve lever to the OPEN position and maintain the lever in this position until the green indicator light comes on. The green indicator light indicates that the door is fully opened and locked.

Note: *The yellow hydraulic system is pressurized (the YELLOW ELEC PUMP is energized). The operation of the flight controls and PTU is inhibited.*

When the door is fully open, release the selector valve lever. When released, the selector valve lever returns to the neutral position and shuts down the electrical pump.

CLOSING

In order to close the cargo door, set the selector valve lever to the CLOSE position and maintain the lever in this position until the green indicator light goes off. When this light goes off, it means that the door is fully closed and locked.

Note: *At first the selector valve lever locks in an intermediate position maintaining a preset pressurization to prevent the door from dropping open.*

When the door is fully closed, the selector valve lever returns to the neutral position and shuts down the electrical pump.
On the cargo door, push the door handle flap downwards to the LOCKED position. When the door is locked, the cargo door symbol appears in green on the DOOR/OXY SD page. The CARGO door indication on the ECAM goes off, and the handle flap mechanism locks the operating handle.
Close the access door of the service panel.

HOW TO OPERATE THE FWD AND AFT CARGO DOORS (AUXILIARY OPERATION)

Ident.: DSC-52-50-00020577.0002001 / 17 MAR 17
Applicable to: ALL

AUXILIARY OPERATION

If there is an electrical failure or if the yellow hydraulic electric pump fails, the operator can open or close the cargo door with the use of the hand pump that is accessible via the ground service panel.

Note: *Two persons are necessary for this operation.*

MANUAL OPENING

To open the cargo door with the use of the hand pump, unlock the cargo door by using the operating handle as for normal operation.
Open the ground service panel of the yellow hydraulic system that is in the belly fairing area.
Open the access door of the door service panel. Set the selector valve lever to the OPEN position and maintain the lever in this position during the operation of the hand pump.
Operate the hand pump until the cargo door is in the fully open position. The green light comes on and indicates that the door is fully opened and locked.
When the cargo door is fully opened, release the selector valve lever of the door service panel.

MANUAL CLOSING

To close the cargo door, set the selector valve lever (on the door service panel) to the CLOSE position and maintain the lever in this position during the operation of the hand pump.
Operate the hand pump until the cargo door is in the fully closed position.
When the cargo door is fully closed, release the selector valve lever of the door service panel.
Lock the cargo door with the use of the operating handle as for normal operation.
Close the access door of the door service panel and of the ground service panel.

ERRONEOUS ACTIVATION OF THE CABIN PRESSURE WARNING LIGHTS WITHOUT RESIDUAL DIFFERENTIAL PRESSURE

Ident.: DSC-52-70-00023541.0001001 / 02 DEC 19
Applicable to: ALL

DESCRIPTION

At touchdown, the CPCS automatically operates the opening of the OFV to reduce the differential pressure to a safe level, even when both packs are operating.
However, the differential pressure sensor may have a defect. The CABIN PRESSURE WARNING lights may temporarily come on without residual differential pressure. In that case, the CAB PR EXCESS RESIDUAL PR alert may not trigger.
This erroneous activation of the CABIN PRESSURE WARNING lights can last up to 30 min.

OPERATIONAL RECOMMENDATION

Before the cabin crew opens the cabin door, the flight crew must confirm the absence of residual differential pressure. The flight crew must wait for the CABIN PRESSURE WARNING lights to stop flashing, or perform both of the following actions:

- Check that both air conditioning packs are set to OFF, and
- Open one of the cockpit sliding windows.

If the flight crew cannot open one of the cockpit sliding windows, it means that residual pressure remains. Therefore, the cabin doors MUST NOT BE OPENED. In this case, the flight crew may regularly try to open the cockpit sliding window, to confirm the absence of residual pressure.
If the flight crew can open one of cockpit sliding windows, the flight crew can consider the CABIN PRESSURE WARNING lights as spurious. The flight crew can therefore order the cabin crew to open the cabin doors.

GENERAL

Ident.: DSC-56-10-00000998.0001001 / 17 MAR 17
Applicable to: ALL

The cockpit has fixed and sliding windows.

Intentionally left blank

FIXED WINDOWS

Ident.: DSC-56-20-00000999.0001001 / 17 MAR 17
Applicable to: ALL

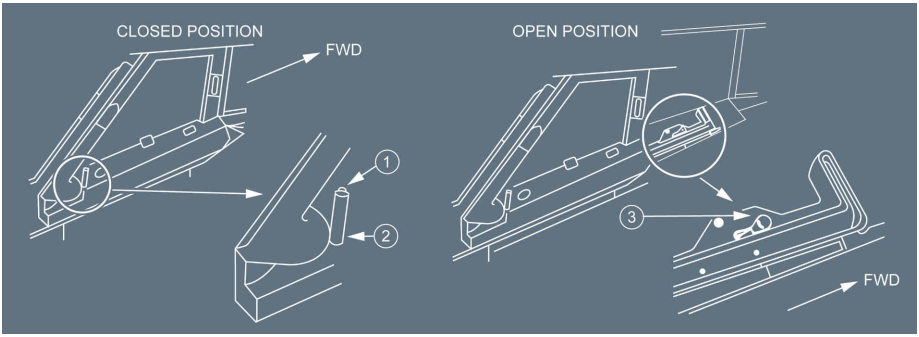
There are four fixed windows :
- two windshields
- two fixed side windows

Intentionally left blank

SLIDING WINDOWS

Ident.: DSC-56-30-00018432.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew can use the sliding windows as emergency exits. Therefore they are not permitted to stow any object so that it protrudes into the window area from the side console. Members of the flight crew can use the control handle to slide each of the windows rearward, and can use a locking pin to lock each window open.



(1) Unlocking button
Flight crew presses this button to unlock the control handle.

(2) Control handle

- To open the window, the crew member pulls inward and rearward.
- To close the window, the crew member pushes forward.

(3) Locking pin
This pin locks the window open.
It is near the window’s lower guide track and is visible when the window is open.

- Forward
  Between the closed position and the one-third open position, the window is free to move forward and aft.
  When the window is more than one-third open, this pin prevents it from moving forward.
- Aft
  Flight crew must move the locking pin aft in order to close the window. Left sliding window.

Intentionally left blank

COCKPIT WINDSHIELD AND WINDOWS DESCRIPTION

All cockpit windows are fail-safe design.
The windows are made of:

- A non structural ply, the Outer ply (1), which is only a protective layer
- Two structural plies, the Middle ply (2) and the Inner ply (3)
  Each structural ply is able to sustain individually the pressurization loads
- A heating film (4) to defog and/or de-ice the windshield/window
- Two interlayers (5).

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

The aircraft has two CFM International CFM56-5B engines that supply power to the aircraft.

Ident.: DSC-70-05-10-00018265.0001001 / 21 MAR 16
Applicable to: ALL

The engines are turbofan engines that have:
- A high bypass ratio,
- A Full Authority Digital Engine Control (FADEC),
- A fuel system,
- An oil system,
- An air system,
- A thrust reverser system,
- An ignition system and a start system.

ENGINE

Ident.: DSC-70-10-00018361.0001001 / 21 MAR 16
Applicable to: ALL

The engine has:
- Two compressor turbine assemblies:
  - The Low Pressure (LP) compressor turbine assembly,
  - The High Pressure (HP) compressor turbine assembly.

L2 Each turbine operates its associated compressor via a shaft.

L1
- One accessory gearbox,
- One combustion chamber.

The engine operates as follows:
1. The LP compressor, compresses the air.
2. Then, the air is divided into two flows:
   - Most of the air flows out of the core engine, and provides most of the engine thrust.
   - The remaining air enters the core engine.
3. The HP compressor compresses the air that enters the core engine.
4. The fuel is added to and mixed with the compressed air of the core engine. The mixture is ignited in the combustion chamber.
5. The gas that results from combustion drives the HP and the LP turbines.

The rotation speed of the fan provides the N1 engine parameter.
The rotation speed of the HP rotor provides the N2 engine parameter.
The N1 and N2 engine parameters appear on the Engine/Warning Display (E/WD).
L2 The N1 and N2 engine parameters are current rotation speeds displayed in percentage.

L1 The FADEC uses:
- The N1 engine parameter to compute the applicable engine thrust,
- The N1 and N2 engine parameters for engine control and monitoring.

2 **Applicable to: MSN 08495-09324, 10949-11597**

LP COMPRESSOR TURBINE ASSEMBLY

The LP compressor turbine assembly has:

- One LP compressor,
- L2 One Fan Drive Gear System (FDGS),
- One LP shaft,
- L1 One LP turbine.

L2 The FDGS is a planetary gear reduction unit that connects the fan rotor to the LP compressor. The LP shaft connects the LP compressor to the LP turbine.

L3 The LP compressor has a fan and 3 stages, and the LP turbine has 3 stages.

LP COMPRESSOR TURBINE ASSEMBLY

The LP compressor turbine assembly has:

- One LP compressor,
- L2 One LP shaft,
- L1 One LP turbine.

L2 The LP shaft connects the LP compressor to the LP turbine.

L3 The LP compressor has a fan and 4 stages, and the LP turbine has 4 stages.

HP COMPRESSOR TURBINE ASSEMBLY

Ident.: DSC-70-10-00018290.0007001 / 09 JAN 18

3 **Applicable to: MSN 08495-09324, 10949-11597**

HP COMPRESSOR TURBINE ASSEMBLY

The HP compressor turbine assembly has:

- One HP compressor,
- L2 One HP shaft,
- L1 One HP turbine.

L2 The HP shaft connects the HP compressor to the HP turbine.
L3 The HP compressor has 8 stages, and the HP turbine has 2 stages.

HP COMPRESSOR TURBINE ASSEMBLY

HP COMPRESSOR TURBINE ASSEMBLY

The HP compressor turbine assembly has:
- One HP compressor,
- L2 One HP shaft,
- L1 One HP turbine.

L2 The HP shaft connects the HP compressor to the HP turbine.
L3 The HP compressor has 9 stages, and the HP turbine has a single stage.

COMBUSTION CHAMBER

Ident.: DSC-70-10-00018292.0001001 / 21 MAR 16
Applicable to: ALL

COMBUSTION CHAMBER

The combustion chamber burns a mixture of fuel and HP air. The FADEC controls the fuel/air mixture in accordance with the position of the thrust lever and the aircraft operating conditions.
L3 The combustion chamber is an annular assembly with fuel nozzles and two igniters.
The combustion chamber is between the HP compressor and the HP turbine.

ACCESSORY GEARBOX

Ident.: DSC-70-10-00018364.0001001 / 21 MAR 16
Applicable to: ALL

ACCESSORY GEARBOX

The accessory gearbox drives various accessories with mechanical power via the HP shaft for the operation of the engine and the aircraft systems.

L2 The accessory gearbox of each engine operates:
- The oil feed pump that provides the oil system with oil.
- The main engine fuel pump that provides the combustion chamber with fuel.
- The engine-driven hydraulic pumps that pressurize the GREEN and the YELLOW hydraulic systems.
- The engine-driven generators that are the primary source of electrical power.
- The FADEC alternator that provides the FADEC with electrical power.
- The pneumatic starter that enables the engine start.

GENERAL

Ident.: DSC-70-20-00020869.0001001 / 17 MAR 17
Applicable to: ALL

Each powerplant has a FADEC (Full Authority Digital Engine Control) system.
FADEC is a digital control system that performs complete engine management.
FADEC has two-channel redundancy, with one channel active and one in standby.
If one channel fails, the other automatically takes control.
The system has a magnetic alternator for an internal power source.
FADEC is mounted on the fan case.
The Engine Interface Unit (EIU) transmits to FADEC the data it uses for engine management.

FUNCTIONS

Ident.: DSC-70-20-00001567.0001001 / 21 MAR 16

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

The FADEC system performs the following functions :

Control of gas generator

- control of fuel flow
- acceleration and deceleration schedules
- variable bleed valve and variable stator vane schedules
- control of turbine clearance
- idle setting

Protection against engine exceeding limits

- protection against N1 and N2 overspeed
- monitoring of EGT during engine start

Power management

- automatic control of engine thrust rating
- computation of thrust parameter limits
- manual management of power as a function of thrust lever position
- automatic management of power (A/THR demand).

Automatic engine starting sequence

- control of :
  - the start valve (ON/OFF)
  - the HP fuel valve
  - the fuel flow
  - the ignition (ON/OFF)
- monitoring of N1, N2, FF and EGT
- initiation of abort and recycle (on the ground only)

Manual engine starting sequence

- passive monitoring of engine
- control of :
  - the start valve
  - the HP fuel valve
  - the ignition

Thrust reverser control

- Actuation of the blocker doors
- Engine setting during reverser operation

Fuel recirculation control

- Recirculation of fuel to the fuel tanks, depending on the engine oil temperature, the fuel system configuration, and the flight phase.

Transmission of engine parameters and engine monitoring information to cockpit indicators

- Primary engine parameters
- Starting system status
- Thrust reverser system status
- FADEC system status

Detection, isolation, and recording of failures

FADEC cooling

FUNCTIONS

Ident.: DSC-70-20-00001567.0003001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

The FADEC system performs the following functions :

Control of gas generator

- control of fuel flow
- acceleration and deceleration schedules
- variable bleed valve and variable stator vane schedules
- control of turbine clearance
- idle setting

Protection against engine exceeding limits

- protection against N1 and N2 overspeed
- monitoring of EGT during engine start

Power management

- automatic control of engine thrust rating
- computation of thrust parameter limits
- manual management of power as a function of thrust lever position
- automatic management of power (A/THR demand).

Automatic engine starting sequence

- control of:
  - the start valve (ON/OFF)
  - the HP fuel valve
  - the fuel flow
  - the ignition (ON/OFF)
- monitoring of N1, N2, FF and EGT
- initiation of abort and recycle (on the ground only)

Manual engine starting sequence

- passive monitoring of engine
- control of:
  - the start valve
  - the HP fuel valve
  - the ignition

Thrust reverser control

- Actuation of the blocker doors
- Engine setting during reverser operation

Fuel recirculation control

- Recirculation of fuel to the fuel tanks, depending on the engine oil temperature, the fuel system configuration, and the flight phase.

Transmission of engine parameters and engine monitoring information to cockpit indicators:

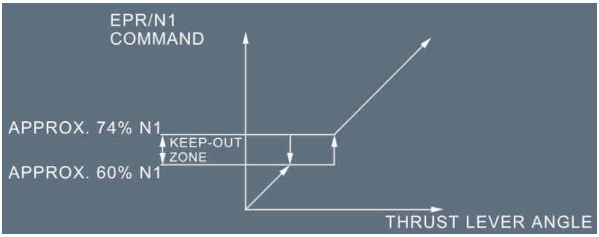
- Primary engine parameters
- Starting system status
- Thrust reverser system status
- FADEC system status

Detection, isolation, and recording of failures

FADEC cooling

Protection against fan flutter

- When on ground at low speed (less than or equal to M 0.1), the Electronic Engine Computer (EEC) protects against fan flutter. In so doing, the EEC prevents the engine from being stabilized between an approximate range of 60 % to 74 % N1 (depending on the outside air temperature). Therefore, during engine acceleration on ground, the pilot may notice a non-linear thrust response to thrust lever movement.



FUNCTIONS

Ident.: DSC-70-20-00001567.0004001 / 16 NOV 15

2 **Applicable to: MSN 08495-09324, 10949-11597**

The FADEC system performs the following functions :

Control of gas generator

- Control of fuel and oil flow
- Acceleration and deceleration schedules
- Variable bleed valve and variable stator vane schedules
- Control of turbine clearance
- Idle setting

Protection against engine exceeding limits

- Protection against N1 and N2 overspeed
- Protection against EGT overlimit, during autostart on ground only

Power management

- Automatic control of engine thrust rating
- Computation of thrust parameter limits
- Manual management of power as a function of thrust lever position
- Automatic management of power (A/THR demand)

Automatic engine starting sequence

- Control of :
  - The start valve (ON/OFF)
  - The HP fuel valve
  - The fuel flow
  - The ignition (ON/OFF)
- Monitoring of N1, N2, FF and EGT

FADEC cooling

Protection against engine stall

Protection against Thrust Control Malfunction

IDLE CONTROL

Ident.: DSC-70-20-00015374.0002001 / 03 DEC 15

3 **Applicable to: MSN 08495-09324, 10949-11597**

The FADEC has the following three idle modes :

Minimum idle

- Is regulated according to :
  - bleed system demand
  - ambient conditions
- Is selected :
  - In flight, when the landing gear is retracted and not in CONF 3 or FULL.
  - On ground, provided reverse is not selected.

Approach idle

- Is regulated according to aircraft altitude, the bleed system demand, and ambient conditions.
- Is selected in flight, in CONF 3 or FULL, or when the landing gear is down.
- Allows the engine to accelerate rapidly from idle to go-around thrust.

Reverse idle

- Is selected on ground, when the thrust lever is in REV IDLE position.
- Is slightly higher than forward idle thrust.

IDLE CONTROL

Ident.: DSC-70-20-00015374.0001001 / 17 NOV 14

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

The FADEC has the following three idle modes :

Modulated idle

- Is regulated according to :
  - bleed system demand
  - ambient conditions
- Is selected :
  - In flight, when the flaps are retracted (FLAPS lever at zero position)
  - On ground, provided reverse is not selected.

Approach idle

- Is regulated according to aircraft altitude, regardless of bleed system demand.
- Is selected in flight, when the flaps are extended (FLAPS lever not at zero position)
- Allows the engine to accelerate rapidly from idle to go-around thrust.

Reverse idle

- Is selected on ground, when the thrust lever is in REV IDLE position.
- Is slightly higher than forward idle thrust.

GENERAL

Ident.: DSC-70-30-10-00020872.0002001 / 17 MAR 17

1 **Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-09324, 10949-11597**

A FADEC dedicated to each engine controls the thrust.
The pilot uses the thrust levers to set the thrust in manual mode, and the FMGS sets the thrust in automatic mode (A/THR function).
The FADEC prevents the thrust from exceeding the limit for the thrust lever position in both manual and automatic modes.

The thrust levers are only manually moved.
The thrust levers move over a sector divided into four operating segments.
The sector has six positions defined by detents or stops.
The FADEC receives the thrust lever position, then computes and displays all of the following:

- The thrust rating limit
- The N1 for the TLA.

Note: *To select reverse idle, the flight crew pulls up the reverse lever. The thrust lever can no longer remain in the idle position.*

THRUST RATING LIMIT

Ident.: DSC-70-30-30-00001571.0002001 / 04 DEC 17

Applicable to: MSN 08495-09324, 10949-11597

The FADEC computes the thrust rating limit for each thrust lever position, as shown below.
If the thrust lever is set in a detent, the FADEC selects the rating limit corresponding to this detent.
If the thrust lever is set between two detents, the FADEC selects the rating limit corresponding to the higher detent.

2

The engines are in the manual mode provided the A/THR function is:
- not armed or
- armed and not active (thrust lever not in the A/THR operating range and no alpha floor).

In these conditions, each engine is controlled by the position of its thrust lever.
The flight crew controls thrust by moving the thrust lever between the IDLE and TOGA positions.
Each position of the thrust lever within these limits corresponds to an N1.
When the thrust lever is in a detent, the corresponding N1 is equal to the N1 rating limit computed by the FADEC for that engine.

POSITION OF THE THRUST LEVER

When the thrust lever is in the FLX/MCT detent:

- **On the ground**
  The engine runs at the flex takeoff thrust rating if the flight crew has selected a flex takeoff temperature on the MCDU that is higher than the current Total Air Temperature (TAT).
  Otherwise the engine produces Maximum Continuous Thrust (MCT).
- **After takeoff**
  The flight crew can change from FLX to MCT by moving the thrust lever to TOGA or CL, then back to MCT. After that, the flight crew cannot use the FLX rating.

  Note: Setting the thrust lever out of FLX/MCT detent without reaching TOGA or CL detent has no effect.

The flight crew can always get MAX TO thrust by setting the thrust levers to TOGA.
In go-around, the A/THR controls the thrust in accordance with the following thrust lever position:

- At the TOGA detent, the thrust target is the TOGA thrust
- At the FLX/MCT detent, when TOGA was previously set in the case of soft go-around, the thrust target is one of the following:
  - The thrust to target a vertical speed of approximately 2 300 ft/min, or
  - The maximum thrust (TOGA) if the 2 300 ft/min target cannot be reached.

INDICATIONS ON FMA

The FADECs monitor the positions of the thrust levers, and trigger appropriate indications on the FMA. *Refer to DSC-22_30-80-20 MAN TOGA*.

THRUST CONTROL MALFUNCTION LOGIC

Ident.: DSC-70-30-40-00005364.0003001 / 16 NOV 15

5 **Applicable to: MSN 08495-09324, 10949-11597**

The FADEC provides a protection in the case of uncontrollable high thrust during critical flight phases: the Thrust Control Malfunction (TCM) protection.
The TCM protection is active on ground and during the takeoff and the approach phases.

TCM protection logic enables the following:
- Detection of the Thrust Control Malfunction
- Reaction to the detected Thrust Control Malfunction

A Thrust Control Malfunction is detected either:
- When actual N1 exceeds the commanded N1 value increased by 3 %, or
- When actual N1 exceeds the maximum possible N1 value for takeoff.

When a Thrust Control Malfunction is detected, the TCM protection function performs the following:

- Shuts down the engine on ground if thrust levers are at idle or in reverse position, or
- Reduces the fuel flow during flare and approach phases.

Intentionally left blank

GENERAL

Ident.: DSC-70-35-10-00020875.0001001 / 17 MAR 17

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

A FADEC dedicated to each engine controls the thrust.
The pilot uses the thrust levers to set the thrust in manual mode, and the FMGS sets the thrust in automatic mode (A/THR).
The FADEC prevents the thrust from exceeding the limit for the thrust lever position in both manual and automatic modes.
The engine thrust setting is made through control of the Engine Pressure Ratio (EPR).

EPR = Low Pressure Turbine exhaust pressure (P5)/Engine inlet pressure (P2)

Intentionally left blank

GENERAL

Ident.: DSC-70-35-20-00001576.0001001 / 21 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

The FADEC has two mode of power setting, EPR and N1 modes.

EPR MODE

Ident.: DSC-70-35-20-00020876.0001001 / 17 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

EPR mode is the normal mode to control the thrust.
The required EPR is set by controlling the fuel flow.

The FADEC computes the command EPR as a function of:
- Thrust Lever Angle (TLA)
- Altitude
- Mach number
- Ambient temperature
- Air inlet total temperature (T2)
- Extracted bleed air.

N1 MODES

Ident.: DSC-70-35-20-00020877.0001001 / 10 MAY 21
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

If no EPR is available (either sensed or computed) the affected FADEC will automatically revert to N1 mode.
Depending on the failure case leading to EPR mode loss, the FADEC will revert to either rated or degraded mode.
At the reversion to N1 mode (rated or degraded) an equivalent thrust to that achieved in EPR mode is provided until a thrust lever position change.
Autothrust control is lost. Alpha-floor protection is lost.

RATED N1 MODE

An automatic reversion to rated N1 mode occurs in the event of loss of sensed EPR. This occurs when P2 (engine inlet total pressure) and/or P5 (LP turbine exit total pressure) engine parameters are not available.
The FADEC will determine N1 power setting as a function of TLA, altitude and engine inlet total temperature.

The rated N1 mode can also be manually selected through the ENG N1 MODE pb-sw on the overhead panel.

DEGRADED N1 MODE

An automatic reversion to degraded N1 mode occurs in the event of loss of computed EPR due to the loss of T2 (engine inlet total air temperature) or ambient pressure (ambient pressure engine sensor) engine parameters.

The N1 is defined as a function of TLA only and is limited by the FADEC to either:
- The smallest of maximum N1 or N1 redline, if T2 is available, or
- The N1 redline if T2 is not available.

The degraded N1 mode is an unrated N1 mode.
The N1 rating limit and maximum N1 indications on ECAM E/WD are lost.
In electrical emergency configuration, the EPR mode is lost on both engines, and each FADEC reverts to the degraded N1 mode.

Note: *An overboost can occur during reversion in the degraded N1 mode, with thrust lever at full forward position.*

EPR RECOVERY LOGIC

Ident.: DSC-70-35-20-00001579.0001001 / 03 APR 13
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

With the FADEC in either rated or degraded N1 mode, switching OFF the ENG N1 MODE pb on the overhead panel will permit to return to the EPR mode if the failure has disappeared.

The HP compressor shaft drives the HP fuel pump assembly. Fuel flows through the LP pump, then through the fuel/oil heat exchanger and the HP pump (gear pump).

The fuel then divides into a filtered flow for the servo fuel heater and the servo valves of the HMU, and an unfiltered flow for the metering valve of the HMU.

SHUT-OFF VALVES

Ident.: DSC-70-40-00001587.0001001 / 12 MAY 16

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

Moving the ENG1 (ENG2) MASTER switch to OFF directly commands the closing of the LP and HP fuel shut off valves for that engine's fuel system.
It also closes the fuel return valve and opens the bypass valve.

GENERAL

The FADEC controls the HMU, which :
- controls fuel flow to the engine combustion chamber
- controls fuel hydraulic signals to actuators
- protects against overspeeding.

Ident.: DSC-70-40-A-00020880.0001001 / 17 MAR 17

FUEL FLOW

L3 The Fuel Metering Valve (FMV) transforms FADEC orders through a torque motor and servo valve into fuel flow to the engine fuel nozzles.
The FMV resolver generates a feedback signal proportional to the FMV position.
The bypass valve maintains a constant pressure drop across the FMV to ensure that the metered fuel flow is proportional to the FMV position.

L1 The FADEC computes the fuel flow that will maintain the target N1.

As the FADEC maintains this N1, it allows N2 to vary while remaining between N2 minimum and N2 maximum. The FADEC also controls the engine parameters to :
- Limit acceleration and deceleration ;
- Avoid engine stall or flameout ;
- Limit maximum N1 and N2 ;
- Maintain air bleed pressure requirement.

The FADEC computes an N2 correction according to the bleed configuration.

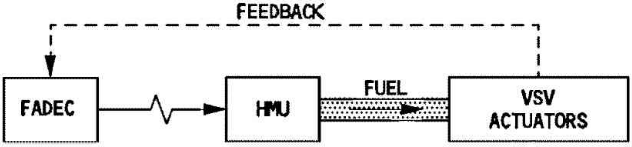
OVERSPEED GOVERNOR SYSTEM

Independent of the FADEC, the overspeed governor limits the N2 by opening the fuel bypass valve, in the event of a malfunction that could lead to an overspeed condition.

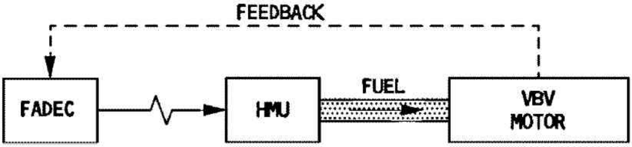
FUEL HYDRAULIC SIGNALS

L3 Fuel hydraulic signals go to :

- Low Pressure Turbine Clearance Control (LPTCC) valves
  (*Refer to DSC-70-60 General*)
- High Pressure Turbine Clearance Control (HPTCC) valves
  (*Refer to DSC-70-60 General*)
- Rotor Active Clearance Control (RACC) system
  (*Refer to DSC-70-60 General*)
- Variable Stator Vanes (VSV)
  The VSV system positions the compressor variable vanes.
  The FADEC maintains optimum compressor efficiency at a steady state and an adequate stall margin for transient engine operation.
  VSVs are fully closed during engine start and are fully open at high thrust.



- Variable Bleed Valves (VBV)
  The FADEC controls the VBVs, upstream of the HP compressor. Their setting depends on compressor inlet temperature and on N2. It varies between full open (start, low thrust, and during fast deceleration) and full closed (high thrust) positions.



IDG COOLING SYSTEM

Ident.: DSC-70-40-00001593.0001001 / 26 JUL 12

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

Some of the fuel flowing out of the HMU goes to cool the oil systems of the Integrated Drive Generators (IDGs). It then returns to the fuel pump unit or to the tank.
The Fuel Return Valve (FRV), controlled by the FADEC, ensures that this flow is adequate.
L3 At low engine thrust, if the oil going into the IDG is too hot, the cooling fuel is sent back to the tank (300 kg/h).
If oil temperature continues to rise, the ECU increases the minimum N2.
If oil temperature still keeps rising, the FADEC increases the fuel flow to the tank (from 300 to 600 kg/h, depending on fuel return temperature).
The fuel return valve is always mixing hot fuel with cold fuel so that the temperature of fuel returning to the tank stays below 100 °C (from 200 to 400 kg/h, depending on fuel return temperature).

Fuel recirculation to the tank is inhibited (FRV closed) in the following cases :
- at engine shutdown
- during takeoff and climb
- if :
  - wing tank level is below about 300 kg (660 lb).
  - there is fuel overflow in the surge tank
  - fuel feed is by gravity only.
- when fuel temperature in the wing tank in flight is above 52.5 °C

Note: *On the ground, high fuel temperature in the wing tank or fuel overflow in the surge tank does not inhibit the fuel recirculation to the wing tank (FRV remains open).*

The fuel system enables the combustion of fuel under appropriate conditions of flow rate and pressure. The FADEC controls the fuel supply via the Fuel Metering Unit (FMU).
High pressure fuel is also used to provide pressure for some actuators.

The major components are :
- High and low pressure fuel pumps (dual unit)
- Fuel/oil heat exchanger
- Low pressure fuel filter
- Fuel Metering Unit (FMU)
- Fuel distribution valve
- 20 fuel injectors
- Diverter and return to tank valve
- IDG fuel/oil heat exchanger.

FUEL PUMP UNIT

Ident.: DSC-70-45-00001595.0001001 / 21 MAR 16

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

Consists of the low and high pressure stages which are driven from a common gearbox output shaft.

- The LP stage increases the pressure to :
  - suppress the cavitation
  - account for the pressure losses of the fuel oil heat exchanger and the low pressure fuel filter
  - provide enough pressure at the inlet of the HP stage
- The HP stage increases the pressure to the appropriate level for optimum fuel flow and atomization at all engine operating conditions.

The FADEC controls the Fuel Metering Valve (FMV) which transforms its orders through three torque motors/servo valves.

The FMV :
- Controls the fuel flow
- Protects against overspeeding (by reducing down to the minimum fuel flow).
- Controls the shut off valve (to start or stop the engine)
- Supplies high pressure fuel to the various actuators.

The three FADEC controlled torque motors are used to direct fuel servo pressure to open/close three valves :
- The fuel metering valve meters the fuel supply.
- The overspeed valve reduces the fuel flow in case of a FADEC detected overspeed. This reduction is made according to a preset value.
  Once this valve is operated it remains in the minimum fuel flow position until the engine is shutdown.
- The shut off valve opens/closes to isolate fuel supplies for starting or stopping the engine.

The servo pressure regulator regulates the pressure for FMU internal use.
The FADEC computes the fuel flow that will maintain the target EPR.
As the FADEC maintains this EPR, it allows N2 to vary while remaining between minimum N2 and maximum N2.

The FADEC also controls the engine parameters to :
- Limit acceleration and deceleration ;
- Avoid engine stall or flameout ;
- Limit maximum N1 and N2 ;
- Maintain air bleed pressure requirement.

The FADEC computes an N2 correction according to the bleed configuration.

INTEGRATED FUEL PUMP AND CONTROL (IFPC)

Ident.: DSC-70-48-00015368.0001001 / 21 MAR 16

2 **Applicable to: MSN 08495-09324, 10949-11597**

The Integrated Fuel Pump and Control (IFPC) combines both fuel pump and fuel control functions into a single unit. Therefore, this enables to reduce the number of components installed on the Main Gearbox (MGB).

The IFPC performs the following functions:

- Provide pressurised and metered fuel to the engine to support combustion, and
- Pressurize the fuel for the engine component actuators

The FADEC controls the Fuel Metering Functions of the IFPC which transmits its orders through valves.

The IFPC :
- Commands the Fuel Metering Valve (FMV) to meter the fuel that flow to the engine combustion chamber
- Commands the overspeed valve to reduce the fuel flow in case the FADEC detects overspeed. Once this valve is operated, it remains in the minimum fuel flow position until the engine is shutdown.
- Controls the shut off valve to isolate fuel supplies to start or stop the engine.
- Supplies high pressure fuel to the various actuators

FUEL OIL HEAT EXCHANGER

Ident.: DSC-70-48-00015369.0001001 / 21 MAR 16

3 **Applicable to: MSN 08495-09324, 10949-11597**

The Fuel Oil Heat Exchanger (FOHE) uses the cold fuel to decrease the temperature of the engine oil, and increases the temperature of the fuel.
The heat is continuously transmitted from the oil to the fuel when the engine is in operation. This prevents the fuel from icing.
If the FOHE is clogged (e.g. ice accretion from the upstream pipes), a bypass valve opens to ensure that the fuel continuously flows to the fuel nozzles.

FUEL FILTER

Ident.: DSC-70-48-00015370.0001001 / 21 MAR 16

4 **Applicable to: MSN 08495-09324, 10949-11597**

The fuel filter protects the fuel system from contamination.
The fuel filter is downstream of the FOHE.
A fuel filter bypass valve may open if the fuel filter is clogged. It ensures that fuel continuously flows to the fuel nozzles.

IDG COOLING RECIRCULATION SYSTEM

Ident.: DSC-70-48-00020917.0001001 / 17 MAR 17

5 **Applicable to: MSN 08495-09324, 10949-11597**

The Integrated Drive Generator/Fuel Oil Heat Exchanger (IDG/FOHE) and the main Fuel/Oil heat exchanger enable cooling of both the IDG oil and the engine oil.
Fuel, IDG oil and engine oil temperatures are regulated by the FADEC.

ROTOR ACTIVE CLEARANCE CONTROL (RACC) SYSTEM

The FADEC controls the RACC system through the HMU. The RACC system controls the clearance between the rotor blades of the HP compressor and its stator case.

The RACC system uses fifth-stage compressor bleed air that has been modulated according to the N2 and the flight parameters. The bleed air goes to the N°3 bearing compartment, where it is mixed with fan boost discharge.
Clearances are at the maximum when the RACC valve is closed.

HP TURBINE CLEARANCE CONTROL (HPTCC) SYSTEM

The FADEC controls the HPTCC system through the HMU. The HPTCC system controls the HP turbine clearance by modulating the HP compressor bleed air flow for cooling the HP turbine case. It optimizes HP turbine performance and reduces exhaust gas temperature.

LP TURBINE CLEARANCE CONTROL (LPTCC) SYSTEM

The FADEC controls the LPTCC system through the HMU. The LPTCC system controls LP turbine clearance by modulating the fan bleed air flow for cooling the LP turbine case.

The air bleed system supplies the aircraft with compressed air.

It uses the air for:
- pneumatic system (*Refer to DSC-36-10-10 General*)
- cooling the engine compartment and the turbines
- engine stability.

- Active clearance control for the high and low pressure turbines is to optimize the turbine blade tip clearance by cooling the related turbine cases.
  This control is made by the FADEC through the FMU as a function of the high pressure rotor speed, and altitude.
  In case of failures the system is designed to failsafe to the closed position.
  Should this happen, fuel consumption would be slightly higher.
- LP/HP turbine cooling air.
  Under FADEC control as a function of N2 and altitude, cooling air is taken from the 10th stage of the HPC to cool the HPT second stage blade. The control valve is either fully open or closed and is normally (failsafe) open.

Two air bleed systems (station 2.5 of the LPC and stages 7th and 10th) provide greater compressor stability in the different flight phases.

- The LPC 2.5 bleed valve moves under FADEC control as a function of the low rotor speed, altitude and Mach and is dedicated to improve stall margin during starting, low power or transient operation. The failsafe position of this valve is open.
- The 7th and 10th stage bleed valves are normally closed for most engine operation but fully open for engine starting. Their failsafe position is open. Theses valves are controlled by FADEC through FMU.

In the two cases, the air is vented to the fan air stream.

2 **Applicable to: MSN 08495-09324, 10949-11597**

The cooling of the engine is ensured by two systems:

- The Active Clearance Control (ACC) system that controls the clearance between the blades and the case. The ACC directs cooling air from the fan to the High Pressure Turbine (HPT) and Low Pressure Turbine (LPT) cases.
  This control is made by the FADEC as a function of the high pressure rotor speed, and altitude.
- The LP/HP Turbine Cooling Air (TCA) system that provides a continuous flow of cooling air.
  This cooling air is taken from either 3rd, 6th or 8th stage of the HPC to cool the LP/HP Turbines and the Turbine Intermediate Case (TIC).
  The control valve is either fully open or closed.

ENGINE STABILITY

Ident.: DSC-70-68-00015399.0001001 / 06 JAN 16

3 **Applicable to: MSN 08495-09324, 10949-11597**

The air system ensures the engine stability via the control of the air flow through LP and HP compressors.

This control is made by the FADEC via the airbleed system. This system includes the following:

- The bleed valve at the 6th stage of the HP compressor.
  This valve is normally closed for most engine operation but fully open for engine starting.
- The 2.5 Bleed Compressor valve.
  This valve is controlled by the FADEC as a function of N1, altitude and Mach. The valve enables to improve stall margin during engine start, low power or transient operations.

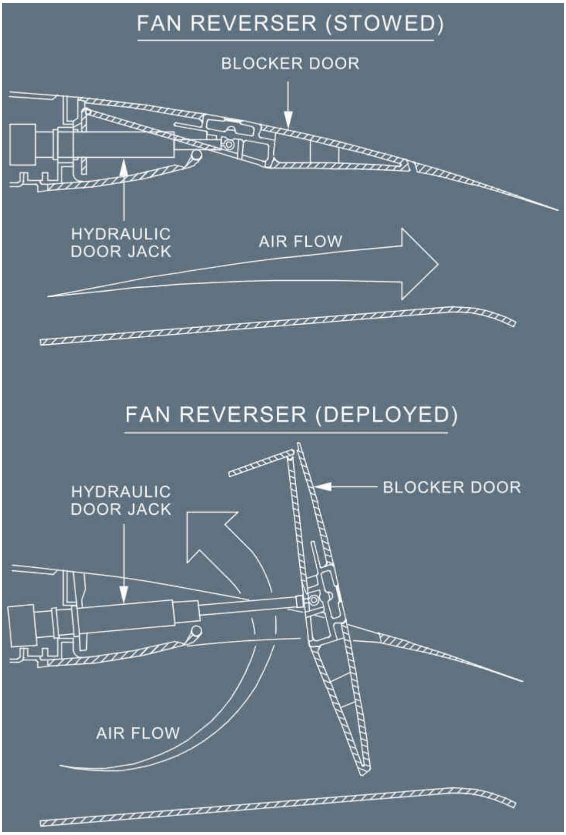
The aircraft reverses engine thrust by using four pivoting blocker doors on each engine to deflect the fan airstream.



FAN REVERSER (STOWED)
BLOCKER DOOR
HYDRAULIC DOOR JACK
AIR FLOW
FAN REVERSER (DEPLOYED)
HYDRAULIC DOOR JACK
BLOCKER DOOR
AIR FLOW

A hydraulic door jack positions each door.
- The green circuit powers the doors on ENG 1.
- The yellow circuit powers the doors en ENG 2.

The FADEC controls the thrust reverser system. Each FADEC channel performs control and monitoring functions. The systems for the two engines are independent of each other.

The thrust reverser system on each engine has :
- 4 actuators,
- 4 latches,

- Door position switches,
- A Hydraulic Control Unit (HCU) that :
  - Pressurizes the thrust reverser hydraulic system,
  - Regulates the speed of the blocker doors, and
  - Supplies actuators with hydraulic power.
- A hydraulic shutoff valve which allows hydraulic pressure to the HCU.

Each pivoting door moves independently (the doors are not synchronized).
The total actuation time is less than two seconds.

ACTUATION LOGIC

Ident.: DSC-70-70-00020920.0001001 / 17 MAR 17
Applicable to: ALL

Deployment requires :
- One FADEC channel, operating with its associated throttle reverse signal ;
- Right and left main gear compressed signal from the corresponding LGCIUs ;
- A Thrust Lever Angle (TLA) reverse signals from at least one Spoiler Elevator Computer (SEC).

Before deployment is completed, the FADEC sets reverse idle thrust on the engine that is having its thrust reversed.

PROTECTION

Ident.: DSC-70-70-00020921.0006001 / 17 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

- IDLE PROTECTION

The FADEC will automatically select the thrust to idle :
- In case of inadvertent thrust reverser deployment (while thrust reversers are commanded stowed), as soon as the thrust reverser feedback position is above 15 % deployed (thrust decreasing toward idle, when the detected position is between 10 % and 15 %).
- In case of inadvertent thrust reverser stowage (while thrust reversers are commanded deployed), as soon as the thrust reverser feedback position is below 78 % deployed (thrust decreasing toward idle between 90 % and 78 %).

PROTECTION

Ident.: DSC-70-70-00020921.0004001 / 17 MAR 17

2 **Applicable to: MSN 08495-09324, 10949-11597**

On ground, the FADEC automatically commands the reverse thrust to stow, if the thrust reversers are not commanded to deploy and :

- The thrust levers are in forward thrust position, and
- One lock failed open

In case of inadvertent thrust reverser deployment (while thrust reversers are commanded stowed) the FADEC automatically selects the thrust to idle. This occurs in flight or on ground as soon as the thrust reverser feedback position is above 5 % deployed.

PROTECTION

Ident.: DSC-70-70-00020921.0002001 / 17 MAR 17

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

- AUTO RESTOW FUNCTION
  The FADEC will automatically command the reverse to stow, if at least one door is unstowed and reverse thrust is not selected while the engine is running.
  Auto restow is inhibited in flight, and on ground, with N1 greater than 70 %.
- IDLE PROTECTION

  The FADEC will automatically select idle thrust if reverse thrust is not selected and :
  - The four doors are detected unstowed, or
  - At least one door is detected unstowed, and hydraulic pressure is detected in the HCU (downstream of the pressurizing valve), or
  - The door position is indefinite, and hydraulic pressure is detected in the HCU (downstream of the pressurizing valve).

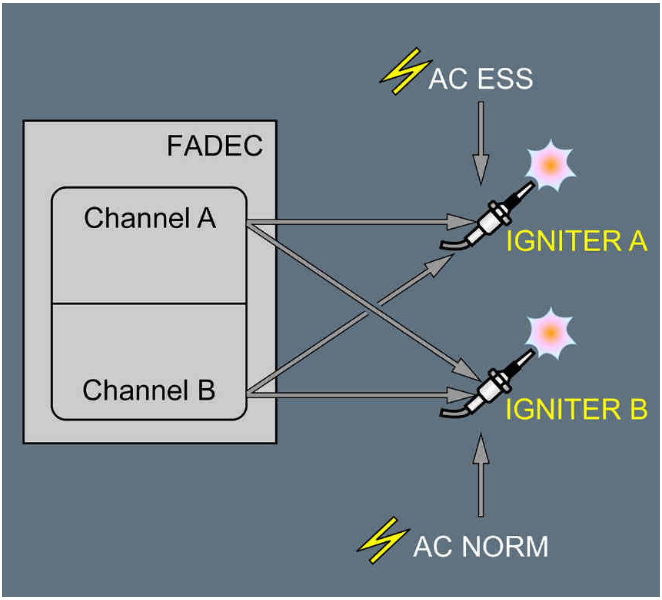
The ignition system is for engine starting on the ground and restarting in flight. It consists of two identical independent circuits for each engine, normally controlled by the FADEC channel A and channel B. Each FADEC channel can control both igniters.



Note: *Supply for igniter A switches to the STAT INV BUS BAR as soon as the static inverter is operative.*

IGNITION FOR STARTING

Ident.: DSC-70-80-30-00020924.0001001 / 28 MAY 20
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

ON THE GROUND

Automatic start:

- During a first automatic start attempt only one igniter is supplied. The FADEC automatically alternates the igniters and/or channels used in successive start sequences.
- The ignition comes on automatically after the dry crank sequence, and cuts off automatically when N2 reaches 43 %
- After an aborted automatic start, the flight crew initiates another automatic start sequence. The FADEC energizes alternate igniters during successive automatic start sequences.

Manual start:

- During a manual start both igniters are supplied, when the ENG MASTER lever is ON
- Both igniters are cut off when N2 reaches 43 %.

IN FLIGHT

In case of start attempt in flight, when the ENG MASTER lever is ON, both igniters are supplied.

IGNITION FOR STARTING

ON THE GROUND

Automatic start:

- During a first automatic start attempt only one igniter is supplied. The FADEC automatically alternates the igniters and/or channels used in successive start sequences.
- The ignition comes on automatically when N2 reaches 16 % and cuts off automatically when N2 reaches 50 %
- During an automatic start, if the first attempt fails, the FADEC automatically initiates a new start attempt with both igniters energized.

Manual start:

- During a manual start both igniters are supplied, when the ENG MASTER lever is ON
- Both igniters are cut off when N2 reaches approximately 50 %.

IN FLIGHT

In case of start attempt in flight, when the ENG MASTER lever is ON, both igniters are supplied.

ON THE GROUND

Automatic start:

- During a first automatic start attempt only one igniter is supplied. The FADEC automatically alternates the igniters and/or channels used in successive start sequences.
- The ignition comes on automatically when N2 reaches 18 % and cuts off automatically when N2 reaches approximately 55 %
- During an automatic start, if the first attempt fails, the FADEC automatically initiates a new start attempt with both igniters energized.

Manual start:

- During a manual start both igniters are supplied, when the ENG MASTER lever is ON
- Both igniters are cut off when N2 reaches approximately 55 %.

IN FLIGHT

In case of start attempt in flight, when the ENG MASTER lever is ON, both igniters are supplied.

CONTINUOUS IGNITION

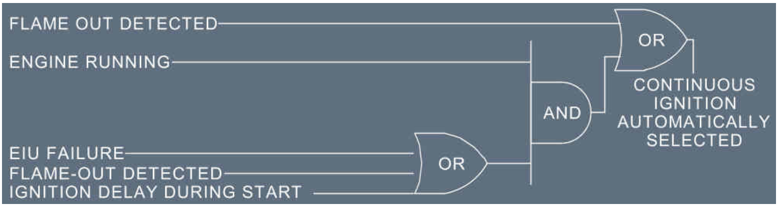
Ident.: DSC-70-80-30-00001620.0004001 / 04 SEP 18
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

Continuous ignition may be selected either manually or automatically to maintain engine combustion.

MANUAL SELECTION

In flight, continuous ignition is on when the ENG MODE selector is on IGN/START, if the corresponding engine is running.
Only one igniter is selected. If failed, both igniters are automatically selected.
On the ground after the engine is started, because ignition cuts off automatically, the flight crew must switch the ENG MODE selector to NORM then back to IGN/START to turn on continuous ignition.

AUTOMATIC SELECTION



FLAME OUT DETECTED
ENGINE RUNNING
OR
AND
CONTINUOUS IGNITION AUTOMATICALLY SELECTED
EIU FAILURE
FLAME-OUT DETECTED
IGNITION DELAY DURING START
OR

WINDMILLING QUICK RELIGHT

In case of inadvertent engine shutdown by cycling the Engine Master lever to OFF then ON, in the windmilling quick relight envelope, the FADEC will attempt automatically a relight regardless of the rotary selector position.

CONTINUOUS IGNITION

Ident.: DSC-70-80-30-00001620.0003001 / 04 SEP 18
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

Continuous ignition may be selected either manually or automatically to maintain engine combustion.

MANUAL SELECTION

In flight, continuous ignition is on when the ENG MODE selector is on IGN/START, if the corresponding engine is running.
On the ground after the engine is started, because ignition cuts off automatically, the flight crew must switch the ENG MODE selector to NORM then back to IGN/START to turn on continuous ignition.
It must be noted that the igniters should be turned off to conserve the life of the ignition system components whenever ignition is not needed on the ground or in flight (mode selector on NORM position).

AUTOMATIC SELECTION

GENERAL

Ident.: DSC-70-80-40-00001621.0001001 / 21 MAR 16
Applicable to: ALL

The engine starting system consists of an air turbine starter and a start valve.
The start valve admits air supplied by the pneumatic system to operate the starter.
The FADEC controls the start valve electrically and bleed pressure is required for opening the start valve. If electrical control fails when the aircraft is on the ground, a handle allows the start valve to be operated manually.

AUTOMATIC STARTING

Ident.: DSC-70-80-40-10-00020932.0001001 / 21 MAR 17
Applicable to: ALL

GENERAL

This sequence is under the full authority of the FADEC, which controls:
- The start valve
- The igniters
- The fuel HP valves.

Ident.: DSC-70-80-40-10-00020933.0008001 / 04 NOV 20
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

PROTECTION

The FADEC:
- Detects a hot start, a hung start, a stall, a failed light up, a low start air pressure and a thrust lever not at idle
- Announces FAULT and identifies the fault in an ECAM message
- Runs an abort sequence if a start aborts on the ground when N2 less than 50 %, and:
  - Closes the HP valve
  - Closes the start valve
  - Turns off ignition
  - Ensures an automatic dry crank cycle after the abort sequence in order to remove the fuel vapors
- Ensures an automatic dry crank sequence of 30 s at maximum motoring speed.

Ident.: DSC-70-80-40-10-00020933.0001001 / 04 NOV 20
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

PROTECTION

The FADEC:
- Detects a hot start, a hung start, a stall, a failed light up, a low start air pressure, a starter time exceeded and a thrust lever not at idle
- Announces FAULT and identifies the fault in an ECAM message
- Runs an abort sequence if a start aborts on the ground, and :
  - Closes the HP valve
  - Closes the start valve
  - Turns off ignition
  - Ensures an automatic dry crank cycle after the abort sequence in order to remove the fuel vapors
  - Controls any additional start attempts.

Ident.: DSC-70-80-40-10-00020933.0004001 / 04 NOV 20
1 **Applicable to: MSN 08495-09324, 10949-11597**

PROTECTION

The FADEC:
- Detects a hot start, a hung start, a stall, a failed light up, a low start air pressure, a starter time exceeded, a thrust lever not at idle and a starter shaft shear
- Announces FAULT and identifies the fault in an ECAM message
- Runs an abort sequence if a start aborts on the ground when N2 less than 55 %, and:
  - Closes the HP valve
  - Closes the start valve
  - Turns off ignition
  - Ensures an automatic dry crank cycle after the abort sequence in order to remove the fuel vapors
  - Controls any additional start attempts.

2 **Applicable to: MSN 08495-09324, 10949-11597**

DRY CRANKING

Depending on the engine thermal state, the FADEC can command an automatic dry cranking before the start of the engine. A memo COOLING is displayed on the E/WD during dry cranking. The dry cranking time is of approximately 2 min.

Ident.: DSC-70-80-40-10-00020934.0002001 / 21 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

DRY CRANKING

During engine start with residual EGT > 250 °C, an auto-crank function motors the engine until EGT decreases below 250 °C.
There is no crew awareness message to indicate the reason for the extended motoring.
This auto-crank function may be activated in very hot condition (typically ISA + 40 °C) or short turn-around times (< 20 min).

Ident.: DSC-70-80-40-10-00020935.0001001 / 28 MAY 20
Applicable to: ALL

WINDMILLING

For an in-flight start, the FADEC decides whether the engine is windmilling fast enough or needs assistance from the starter in view of current engine parameters and flight environment parameters.
Flight crew may interrupt this start sequence by moving the ENG MASTER lever to OFF.

AUTOMATIC STARTING SEQUENCE

Ident.: DSC-70-80-40-20-00020925.0001001 / 21 MAR 17

Applicable to: ALL

INITIAL CONFIGURATION OF THE CONTROLS

The initial configuration prior an automatic engine start is the following :
- The ENG MASTER sw is set to OFF
- The ENG MODE selector is set to NORM
- The ENG MAN START pb-sw is set to OFF.

Ident.: DSC-70-80-40-20-00020927.0001001 / 28 MAY 20
Applicable to: ALL

FIRST STEP

The flight crew must set the ENG MODE selector to IGN/START, leading to the following:
- The ENG SD page page appears on the SD
- All engine parameters are available
- Pack valves automatically close.

After 30 s, if the flight crew does not set the ENG MASTER lever to ON (*Refer to DSC-70-80-40 Second Step*), pack valves automatically open again.

Ident.: DSC-70-80-40-20-00020928.0005001 / 28 MAY 20
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

SECOND STEP

The flight crew must set the ENG MASTER lever to ON, and the following steps occur:
- The LP fuel valve opens
- The engine start valve opens
- After the automatic dry crank sequence (approx. 30 s):
  - The ignition starts
  - The HP fuel valve opens.
- When N2 is more than 43 %:
  - The engine start valve closes
  - The ignition stops
  - The pack valves reopen if another engine is not started within 30 s.

Ident.: DSC-70-80-40-20-00020928.0004001 / 28 MAY 20

3 **Applicable to: MSN 08495-09324, 10949-11597**

SECOND STEP

The flight crew must set the ENG MASTER lever to ON, and the following steps occur:

- The LP fuel valve opens
- The engine start valve opens
- After the automatic dry crank sequence (approx. 2 min):
  - The ignition starts
  - The HP fuel valve opens.
- When N2 is more than 55 %:
  - The engine start valve closes
  - The ignition stops
  - The pack valves reopen if another engine is not started within 60 s.

Ident.: DSC-70-80-40-20-00020928.0001001 / 28 MAY 20

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

SECOND STEP

The flight crew must set the ENG MASTER lever to ON, and the following steps occur:

- The LP fuel valve opens
- The engine start valve opens
- The ignition starts:
  - On ground: when N2 is more than 16 %
  - In flight: Immediately.
- The HP fuel valve opens:
  - On ground: when N2 is more than 22 %
  - In flight: when N2 is more than 15 %.
- When N2 is more than 50 %:
  - The engine start valve closes
  - The ignition stops if on ground
  - The pack valves reopen if another engine is not started within 30 s.

Ident.: DSC-70-80-40-20-00020929.0001001 / 21 MAR 17
Applicable to: ALL

THIRD STEP

The automatic engine start is finished.
The flight crew must set the ENG START selector to NORM.

Ident.: DSC-70-80-40-20-00020930.0001001 / 28 MAY 20
Applicable to: ALL

INTERRUPTION OF THE AUTOMATIC START

When required by ECAM and after confirmation, the flight crew must set the ENG MASTER lever to OFF.

If the flight crew sets the ENG MASTER lever to OFF, the FADEC automatically :
- Closes the LP and the HP fuel shutoff valves
- Stops to energize the ignitor
- Closes the engine start valve.

MANUAL STARTING

Ident.: DSC-70-80-40-00020937.0004001 / 28 MAY 20
4 **Applicable to: MSN 08495-09324, 10949-11597**

If an automatic start is not successful, the flight crew can perform a manual start.
In the manual start sequence, the FADEC has limited control. As a result, the flight crew must monitor engine acceleration.

To perform a manual start, the flight crew must :
- Set the ENG MODE selector to IGN/START
- Set the ENG MAN START pb-sw to ON
- Set the ENG MASTER lever to ON.

The FADEC :
- Opens the engine start valve when the flight crew :
  - Sets the ENG MODE selector to IGN/START
  - Sets the ENG MAN START pb-sw to ON.
- Opens the HP shutoff valve, and operates both igniters when the flight crew sets the ENG MASTER lever to ON
- Closes the engine start valve, and cuts off the ignition when N2 reaches 55 %.

For more information about the manual start sequence, *Refer to PRO-NOR-SUP-ENG Manual Engine Start - General*.

Depending on the engine thermal state, the FADEC can command an automatic dry cranking before the start of the engine. A memo COOLING is displayed on the E/WD during dry cranking. Thy dry cranking is of approximately 2 min.
The FADEC makes a passive survey of the engine during the starting sequence (up to 55 % N2): A dedicated ECAM alert informs the flight crew of an abnormal start, and the flight crew has to interrupt the start sequence.
The FADEC has not the authority to abort the manual start.

MANUAL STARTING

Ident.: DSC-70-80-40-00020937.0002001 / 28 MAY 20
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

If an automatic start is not successful, the flight crew can perform a manual start.
In the manual start sequence, the FADEC has limited control. As a result, the flight crew must monitor engine acceleration.

To perform a manual start, the flight crew must :
- Set the ENG MODE selector to IGN/START
- Set the ENG MAN START pb-sw to ON
- Set the ENG MASTER lever to ON.

The FADEC :
- Opens the engine start valve when the flight crew :
  - Sets the ENG MODE selector to IGN/START
  - Sets the ENG MAN START pb-sw to ON.
- Opens the HP shutoff valve, and operates both igniters when the flight crew sets the ENG MASTER lever to ON
- Closes the engine start valve, and cuts off the ignition when N2 reaches 43 %.

For more information about the manual start sequence, *Refer to PRO-NOR-SUP-ENG Manual Engine Start - General*.
The FADEC makes a passive survey of the engine during the starting sequence (up to 50 % N2): the flight crew is made aware of an abnormal start by a proper ECAM warning and has to interrupt the start sequence. The FADEC has not the authority to abort the manual start.
In flight, the FADEC always commands a starter-assisted air start.

MANUAL STARTING

Ident.: DSC-70-80-40-00020937.0001001 / 28 MAY 20
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

If an automatic start is not successful, the flight crew can perform a manual start.
In the manual start sequence, the FADEC has limited control. As a result, the flight crew must monitor engine acceleration.

To perform a manual start, the flight crew must :
- Set the ENG MODE selector to IGN/START
- Set the ENG MAN START pb-sw to ON
- Set the ENG MASTER lever to ON.

The FADEC:
- Opens the engine start valve when the flight crew :
  - Sets the ENG MODE selector to IGN/START
  - Sets the ENG MAN START pb-sw to ON.
- Opens the HP shutoff valve, and operates both igniters when the flight crew sets the ENG MASTER lever to ON
- Closes the engine start valve, and cuts off the ignition when N2 reaches 50 %.

For more information about the manual start sequence,*Refer to PRO-NOR-SUP-ENG Manual Engine Start - General*.

The FADEC makes a passive survey of the engine during the starting sequence: the flight crew is made aware of an abnormal start by a proper ECAM warning and has to interrupt the start sequence.
The FADEC has not the authority to abort the manual start:
- In flight
- On ground, except if the start EGT limit is exceeded before reaching 50 % N2. In this case only, the FADEC aborts the start.

In flight, the FADEC always commands a starter-assisted air start.

ENGINE VENTILATION (DRY CRANKING)

Ident.: DSC-70-80-40-00020938.0001001 / 21 MAR 17
Applicable to: ALL

A dry cranking cycle ventilates the engine to remove fuel vapors after an unsuccessful start attempt on the ground.

The flight crew can manually select cranking by setting the ENG MODE selector to CRANK and the ENG MAN START pb-sw to ON (ENG MASTER sw OFF). Flight crew can stop the cranking by setting the ENG MAN START pb-sw to OFF.

ENGINE COOLING

Ident.: DSC-70-80-40-00020228.0004001 / 21 OCT 16

5 **Applicable to: MSN 08495-09324, 10949-11597**

Before a start (automatic or manual) or before a manual dry crank cycle, the FADEC can command an automatic dry cranking (engine cooling) to prevent any potential bowed rotor condition. During this engine cooling, the FADEC logic limits the maximum N2 around 10 %.

Note: *A bowed rotor can occur when engine internal components cool at different rates, leading to unequal thermal expansion. This can cause some deflection (or bow) of the rotor shaft.*

The engine cooling time depends on the engine temperature at shutdown, the length of time the engine has been shutdown, the current ambient, and the engine oil temperature.
When the FADEC is powered and if engine cooling is required, a COOLING indication appears on the E/WD for both engines with the expected engine cooling time indicated.
Refer to DSC-70-90-40 Engine Warning Display
When the engine cooling process is completed, the COOLING indication and the expected engine cooling time disappear.

Note: *The FADEC takes into account the previous dry cranking operation to reduce the engine cooling time during the subsequent engine start.*

The FADEC does not initiate any automatic dry cranking during an in-flight engine start.

DUAL COOLING:

Dual cooling is commanded via the DUAL COOLING pb-sw on the overhead panel.
Refer to DSC-70-90-10 ENG DUAL COOLING Panel
The dual cooling function enables that during an automatic start sequence on ground, when the ENG MASTER lever is set to ON, the FADEC commands the cooling on both engines simultaneously (if cooling is required).
The dual cooling function is available in a dedicated envelope of use depending on the APU performance, and on engine oil temperature.
Refer to DSC-70-80-40 Automatic Engine Start with Dual Cooling - Envelope

Note: *The dual cooling function is available if the COOLING message is indicated for both engine on the E/WD.*

AUTOMATIC ENGINE START WITH DUAL COOLING - ENVELOPE

Ident.: DSC-70-80-40-00020229.0020001 / 04 JUN 19
Applicable to: MSN 08529

When engine cooling is required, the dual cooling function enables the crew to perform an automatic dry cranking on both engines simultaneously. The function is available in a dedicated envelope of use depending on both the APU performance and the engine oil temperature.

CAUTION	The dual cooling function is designed for use with APU bleed air only.

Dual Cooling Assisted by APU

ENG MODE START selector

NORM : Normal mode of operation.

IGN/START : Use the IGN/START position to:

- Initiate the automatic or manual start sequences of the associated engine, when the ENG MASTER lever is set to OFF, or
- Initiate the ignitors in flight as required.

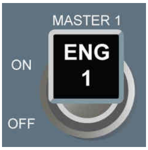
L13

CRANK : Use the CRANK position to:

- Initiate the dry crank process of the associated engine, when the ENG MASTER lever is set to OFF and the ENG MAN START pb-sw is set to ON.
- Initiate the wet crank process of the associated engine for maintenance purpose, when the ENG MASTER lever, and the ENG MAN START pb-sw are set to ON.

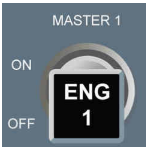
Ident.: DSC-70-90-20-30-00018371.0001001 / 28 MAY 20

ENG MASTER lever



The FADEC:

- Initiates the automatic start sequence of the associated engine, when the ENG MODE selector is set to IGN/START, or
- Initiates the manual start sequence of the associated engine, when the ENG MODE selector is set to IGN/START and the ENG MAN START pb-sw is set to ON.



The FADEC:

- Shuts down the associated engine, or
- Aborts the start sequence of the associated engine.

Ident.: DSC-70-90-20-30-00018372.0001001 / 21 MAR 17

ENG 1(2) FIRE light

FIRE Light :
A fire is detected in the corresponding engine.
Refer to DSC-26-20-20 ENG 1(2) FIRE Light

ENG 1(2) FAULT light

FAULT light :
This amber light comes on, and a caution appears on ECAM, if there is:

- The position of the HP fuel shutoff valve is abnormal, or
- The automatic start sequence of the associated engine aborts, or
- There is a malfunction of the thrust control.

THRUST LEVERS

THRUST LEVERS

The flight crew uses the thrust levers in order to:
- Adjust the thrust, or
- Select a thrust stop or detent, or

- Control the deployment and the stowage of the associated reversers, or
- Adjust the associated reverse thrust.

The flight crew can move each thrust lever individually.

L2 The position of the thrust levers appears on the E/WD, via a blue circle on the thrust gauge.

L1 The flight crew can move each thrust lever forward the Idle (0) stop, when the associated thrust reverser lever is set to the locked position.
The flight crew can move each thrust lever backward the Idle (0) stop, when the associated thrust reverser lever is in the unlocked position.

Ident.: DSC-70-90-20-40-00018377.0001001 / 28 MAY 20

THRUST DETENTS AND STOPS

There are three stops and three detents:
- The Rev Max (F or FULL) stop
- The Rev Idle (R or REV) detent
- The Idle (0) stop
- The Climb (CL) detent
- The Maximum Continuous Thrust (MCT)/Flexible Take Off (FLX) detent
- The Takeoff (TO)/Go-Around (GA) stop.

Ident.: DSC-70-90-20-40-00018378.0001001 / 21 MAR 16

THRUST REVERSER LEVERS

The flight crew uses the thrust reverser levers in order to unlock the associated thrust lever.
The flight crew can move each thrust reverser lever upward to the unlocked position, when the associated thrust lever is set to the Idle (0) stop.
The thrust reverser levers are automatically reset to the locked position, when the flight crew moves the thrust levers forward the Idle (0) stop.

Ident.: DSC-70-90-20-40-00018379.0001001 / 18 MAY 22

A/THR Instinctive Disconnect pb

Pressing the A/THR instinctive disconnect pb disconnects the A/THR.

L2 For more information about A/THR instinctive disconnect pb, *Refer to DSC-22_30-50-40 A/THR Disconnection*.

THRUST RATING MODE AND THRUST LIMIT VALUE

Indicates the thrust limit value and the associated thrust rating mode based on:

- The position of the thrust levers,
- Aircraft on ground or in flight,
- The engine status, i.e. running or not running,
- The data entered in the T.O and CLB panels of the FMS ACTIVE/PERF page.

THRUST RATING MODES

The thrust rating modes are:

TOGA : Takeoff or go-around thrust rating mode is selected.
MCT : Maximum continuous thrust rating mode is selected.
CLB : Climb thrust rating mode is selected.
FLX : Flexible takeoff thrust rating mode is selected.
D04 : Derated takeoff ◁ thrust rating mode is selected.
There are several levels of derated takeoff: D04, D08, D12, D16, D20, ...
GA SOFT : Soft go-around ◁ thrust rating mode is selected.
MREV : Maximum reverse thrust rating mode is selected.

Ident.: DSC-70-90-40-50-00018203.0002001 / 21 MAR 16

5 **Applicable to: MSN 08495-09324, 10949-11597**

BLEED AIR CONFIGURATION

PACKS : The engine bleeds supply the air conditioning packs.
NAI : The engine nacelle anti-ice is on.
WAI : The wing anti-ice is on.

All indications can appear independently.

L2 They appear:

- On ground, when at least one engine is running
- During takeoff or go-around phase, until thrust lever reduction to the CL detent
- In flight, when thrust rating mode is MCT.

Ident.: DSC-70-90-40-50-00018209.0001001 / 21 MAR 16
Applicable to: ALL

IDLE INDICATION

Both engines are at idle speed, and the aircraft is in flight.

L2 Pulses during 10 s, and then remains steady.

Ident.: DSC-70-90-40-50-00018210.0001001 / 21 MAR 16
Applicable to: ALL

AVAIL INDICATION ◁

The engine is started, and at or above idle.

L2 On ground, appears steady during 10 s after a successful start. In flight, pulses during 1 min after a successful relight.

The AVAIL Indication ◁ disappears when the flight crew moves the thrust lever forward the idle detent.

Ident.: DSC-70-90-40-50-00018211.0001001 / 21 MAR 16
Applicable to: ALL

REV INDICATION

REV in green : On ground, the thrust reverser system is fully deployed.

L12

REV in amber : The thrust reverser system is unlocked.
In flight, the REV indication pulses during 9 s and then remains steady.

7 **Applicable to: MSN 08495-09324, 10949-11597**

EGT LIMIT

The amber line indicates the maximum EGT (i.e. the EGT limit).
L2 The maximum EGT is set at 1 043 °C as soon as the engine is started.
The EGT limit does not appear:

- During engine start or engine relight, or
- When a takeoff or a go-around mode is selected, or
- When the thrust reversers are selected, or
- If the alpha floor protection is activated.

Ident.: DSC-70-90-40-50-00018218.0007001 / 21 MAR 16
Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165

EGT LIMIT

The amber line indicates the maximum EGT (i.e. the EGT limit).
L2 The maximum EGT is:

- 635 °C, during the engine start sequence on ground, or
- 610 °C, in all other cases.

The EGT limit does not appear:

- When a takeoff or a go-around mode is selected, or
- When the thrust reversers are selected, or
- If the alpha floor protection is activated.

Ident.: DSC-70-90-40-50-00018218.0003001 / 21 MAR 16
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

EGT LIMIT

The amber line indicates the maximum EGT (i.e. the EGT limit).
L2 The maximum EGT is:

- 725 °C, during the engine start sequence on ground, or
- 915 °C, in all other cases.

The EGT limit does not appear:

- When a takeoff or a go-around mode is selected, or
- When the thrust reversers are selected, or
- If the alpha floor protection is activated.

Ident.: DSC-70-90-40-50-00018218.0001001 / 21 MAR 16

EGT LIMIT

The amber line indicates the maximum EGT (i.e. the EGT limit), when different than the EGT red limit.
L2 The maximum EGT is:

- 635 °C, during the engine start sequence on ground, or
- 610 °C, in all other cases.

The EGT limit does not appear:

- When a takeoff or a go-around mode is selected, or
- When the thrust reversers are selected, or
- If the alpha floor protection is activated.
- During the engine start sequence on ground.

Ident.: DSC-70-90-40-50-00018219.0001001 / 21 MAR 16
Applicable to: ALL

EGT EXCEEDANCE

The EGT exceedance is the highest value that the EGT reached.
The EGT exceedance appears when:

- The current EGT exceeds the EGT red limit, or
- The EGT exceeded the EGT red limit.

L2 The red mark no longer appears at the next engine start sequence on ground, or after a maintenance action.

Ident.: DSC-70-90-40-50-00018220.0007001 / 21 MAR 16
Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165

EGT RED LINE

The EGT red line appears between the EGT red limit and the end of the scale.
L2 The EGT red limit is 650 °C.

Ident.: DSC-70-90-40-50-00018220.0006001 / 21 MAR 16
8 **Applicable to: MSN 08495-09324, 10949-11597**

EGT RED LINE

The EGT red line appears between the EGT red limit and the end of the scale.
L2 The EGT red limit is 1 083 °C.

N2

In a grey box : The engine start sequence or the crank process is in progress.

Green: : N2 is in normal range.

L12

Red : N2 exceeds the N2 red limit.
N2 red limit is 100 %.
A red cross appears.
The red cross no longer appears at the next engine start sequence on ground, or after a maintenance action.

L12

Dashed : The accuracy of the N2 measurement is degraded.
Two amber dashes appear over the last digit.

Ident.: DSC-70-90-40-50-00018243.0001001 / 21 MAR 16
Applicable to: ALL

FUEL FLOW

Green : The fuel flow is normal.

Note: *If the system detects a discrepancy between the N1, N2, EGT and fuel flow values on the FADEC-DMC bus and the corresponding displayed values, an amber CHECK appears underneath the affected parameter.*

Ident.: DSC-70-90-40-50-00018244.0001001 / 21 MAR 16
Applicable to: ALL

THRUST BUMP ◁ INDICATION

Green	:	Indicates that the thrust bump is engaged.
Amber	:	When on the ground, indicates that the thrust bump is selected but not engaged.
Cyan	:	When on the ground, Indicates that the thrust bump is selected.

Ident.: DSC-70-90-40-50-00018563.0003001 / 16 JUN 16
18 **Applicable to: MSN 08495-09324, 10949-11597**

COOLING INDICATION

The green COOLING indication is displayed when an automatic dry crank is required to cool the engine before it starts. The timer indicates the time of the automatic dry crank before the engine start.
The COOLING indication can be displayed for automatic and manual start.

FUEL USED INDICATION

L12

Green	:	Indicates the fuel used by each engine. This value automatically resets on ground, at the next engine start. Appears in multiples of 10 kg (20 lb).

L12

Dashed	:	The value accuracy is degraded. Two amber dashes appear over all five digits. This occurs when the Fuel Flow is not valid in flight, for more than 1 min.

Ident.: DSC-70-90-40-60-00018260.0001001 / 21 MAR 16
Applicable to: ALL

FUEL FILTER CLOG INDICATION

Indicates that the pressure loss across the fuel filter is excessive.

Ident.: DSC-70-90-40-60-00018262.0006001 / 22 MAR 16
20 **Applicable to: MSN 08495-09324, 10949-11597**

OIL QUANTITY

L12

Green	:	The oil quantity is in normal range. The scale goes from 0 to 35 QT.
Pulses green	:	The oil quantity goes below the oil advisory limit (1.20 QT), that corresponds to the amber mark. The needle and the oil quantity value pulse green. The indication pulses, when oil quantity goes below 1.45 QT, and remains pulsing as long as oil quantity is below 2.95 QT.

Ident.: DSC-70-90-40-60-00018262.0002001 / 22 MAR 16
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

OIL QUANTITY

L12

Green	:	The oil quantity is in normal range. The scale goes from 0 to 22 QT.
Pulses green	:	The oil quantity goes below the oil advisory limit (3 QT), that corresponds to the amber mark. The needle and the oil quantity value pulse green. The indication pulses, when oil quantity goes below 3.25 QT, and remains pulsing as long as oil quantity is below 4.75 QT.

Ident.: DSC-70-90-40-60-00018262.0001001 / 22 MAR 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

OIL QUANTITY

L12

Green	:	The oil quantity is in normal range. The scale goes from 0 to 27.5 QT.
Pulses green	:	The oil quantity goes below the oil advisory limit (5 QT), that corresponds to the amber mark. The needle and the oil quantity value pulse green. The indication pulses, when oil quantity goes below 5.25 QT, and remains pulsing as long as oil quantity is below 6.75 QT.

Ident.: DSC-70-90-40-60-00018261.0006001 / 21 MAR 16
21 **Applicable to: MSN 08495-09324, 10949-11597**

OIL PRESSURE

L12

Green	:	The oil pressure is in normal range. The scale goes from 0 to 450 PSI.

L12

Pulses green	:	The oil pressure is above the advisory limit. The advisory limit is 259 PSI.

L12

Amber	:	The oil pressure is in amber range. The amber range is between the upper red threshold and the upper amber threshold. The upper amber threshold varies with N2, and increases from 75 PSI at idle, to 186 PSI at high thrust.

L12

Red	:	The oil pressure is in the red range. The red range is between 0 PSI and the upper red threshold. The upper red threshold varies with N2, and increases from 65 PSI at idle, to 176 PSI at high thrust.

Ident.: DSC-70-90-40-60-00018261.0002001 / 28 MAY 20

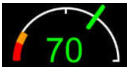
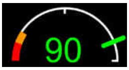
OIL PRESSURE

L12



Green
The oil pressure is in normal range.
The scale goes from 0 to 100 PSI.

L12



Pulses green
The oil pressure is:

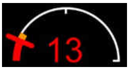
- Above 90 PSI, or

The oil pressure stops pulsing when oil pressure goes below 85 PSI.

- Between 13 PSI and 16 PSI, when N2 is above 75 %.

The oil pressure stops pulsing when oil pressure goes above 20 PSI.

L12



Red
The oil pressure is in the red range.
The red range is between 0 and 13 PSI.

Ident.: DSC-70-90-40-60-00018261.0001001 / 21 MAR 16

OIL PRESSURE

L12

Green : The oil pressure is in normal range.
The scale goes from 0 to 400 PSI.

L12

Pulses green : The oil pressure is above the advisory limit.
The advisory limit is 390 PSI.
The oil pressure stops pulsing, when oil pressure goes below 385 PSI.

L12

Amber : The oil pressure is in amber range.
The amber range is between 60 and 80 PSI.

L12

Red : The oil pressure is in the red range.
The red range is between 0 and 60 PSI.

Ident.: DSC-70-90-40-60-00018263.0007001 / 30 AUG 18

22 **Applicable to: MSN 04827-04860, 06634, 06871, 07081-07098**

OIL TEMPERATURE

Green	:	The oil temperature is in normal range.
Pulses green	:	The oil temperature is between the advisory and caution thresholds for less than 15 min.
Amber	:	The oil temperature is: - Between the advisory and caution thresholds for more than 15 min, or - Above the caution threshold, or - Under the minimum temperature before takeoff threshold.

Ident.: DSC-70-90-40-60-00018263.0006001 / 21 MAR 16

23 **Applicable to: MSN 08495-09324, 10949-11597**

OIL TEMPERATURE

Green	:	The oil temperature is in normal range.
L12 Pulses green	:	The oil temperature is between the advisory and caution thresholds for less than 15 min. The advisory threshold: - Varies with engine power level, - Decreases from 146 °C at idle, to 141 °C at cruise thrust, and to 135 °C at high thrust.
L12 Amber	:	The oil temperature is: - Between the advisory and caution thresholds for more than 15 min, or - Above the caution threshold, or - Below 51.7 °C. The caution threshold: - Varies with engine power level, - Decreases from 152 °C at idle, to 146 °C cruise thrust, and to 141 °C at high thrust.

NACELLE TEMPERATURE INDICATION

The nacelle temperature indication appears when the nacelle temperature of at least one engine goes above the advisory limit if not during the start sequence.

Green :	The nacelle temperature is normal.

L12

Pulses green :	The nacelle temperature goes above the advisory limit. The advisory limit is 320 °C.

MEMO DISPLAY

Ident.: DSC-70-90-50-A-00019566.0001001 / 13 MAY 16
1 **Applicable to: MSN 08495-09324, 10949-11597**

ENG 1(2) COWL	:	This memo appears in amber, when the engine fan cowl is not closed on ground.

Ident.: DSC-70-90-50-A-00018777.0001001 / 13 MAY 16
Applicable to: ALL

IGNITION	:	This memo appears in green when continuous ignition is activated on any engine.

Ident.: DSC-70-90-50-A-00020037.0003001 / 09 APR 18
2 **Applicable to: MSN 08635, 10949-11597**

DUAL COOLING	:	This memo appears in green when the dual cooling function is armed, i.e. when the DUAL COOLING pb-sw is ON. This memo appears in amber when the alert ENG DUAL COOLING - NOT AVAIL is triggered.

Ident.: DSC-70-90-50-A-00020037.0001001 / 21 OCT 16
Applicable to: MSN 08495-08596, 09190-09324

DUAL COOLING	:	This memo appears in green when the dual cooling function is armed, i.e. when the DUAL COOLING pb-sw is ON.

Intentionally left blank

ERRONEOUS DETECTION OF ENGINE FUEL LEAK

Ident.: DSC-70-95-00024094.0001001 / 28 MAY 20

1 **Applicable to: MSN 08495-09324, 10949-11597**

DESCRIPTION

A spurious display of the ENG 1(2) FUEL LEAK alert may occur on an engine that is not affected by a fuel leak.
One of the triggering conditions of the ENG 1(2) FUEL LEAK alert is a comparison between the fuel flows of both engines. A misbehaviour of an engine may cause the fuel flow of this engine to decrease. In this case, if both thrust levers are in the same position, the FWC may erroneously consider that a fuel leak affects the engine that has the highest fuel flow.
The ENG 1(2) FUEL LEAK alert requires the flight crew to shutdown the affected engine, if they confirm the fuel leak.
For more information about the fuel leak detection, *Refer to PRO-ABN-FUEL [QRH] FUEL LEAK*.

OPERATIONAL RECOMMENDATION

Before the flight crew considers an engine shutdown, they should check engine and fuel parameters on both engines (e.g. N1, FOB, FU, fuel flow, fuel distribution, fuel imbalance), in order to confirm the leak.
For more information about the fuel leak, *Refer to FCTM/PR-AEP-FUEL Fuel Leak*.
